Paulstra S.N.C

61, rue Marius Aufan - 92309 Levallois-Perret Cedex

T : +33 1 40 89 53 31

F : +33 1 47 57 28 96

We make it **possible**

**Creator of solutions to ensure the vibration insulation, acoustic, dynamic sealing and power transmission functions.**

# SERVICES

## TECHNICAL RECOMMENDATIONS

The Hutchinson Paulstra's commercial team support you in the right choice of product for your project.

Thanks to our technical recommendations software, our experts analyse your data and external context to extract a transmissibility curve.

## PAULSTRASOFT MOBILE APPLICATION

The Paulstrasoft Mobile application allows to measure the vibratory frequency of a machine in operation and to recommend a suitable antivibration support.

It is free to use and download on the App Store (iOS) and the Play Store (Android).

## VIBRO-ACOUSTIC ANALYSIS

Hutchinson Paulstra brings you its experience for the "in situ" measurement, in order to give a "vibroacoustic" diagnostic of your installation as well as in the implementation of solutions in your environment.

Our services :

- On-site displacement
- Vibratory and acoustic recording
- Analyzing of the results in our place
- A detailed report
- Proposing and supplying the antivibration and acoustic solutions

## PAULSTRASOFT

Paulstrasoft software allows to determine the appropriate antivibratory solution to meet your expectations. It is free to download and use.

This antivibratory mount preselection tool offers several functions :

- vibratory attenuations
- stops calculations
- shocks responses calculations
- products datasheets

## ELASTOMER MOUNTS

page 21

A complete range bringing a technical solution to neutralize the noise transmission and vibrations, and ensure a protection against shocks.

## ACOUSTIC FOAMS

page 169

A complete range of complex insulations and acoustics foams to reduce the airborne noises (insulation, absorption and damping).

## METAL MOUNTS

page 193

Reduce considerably the float and the frictions, the bushes minimize wear on moving parts and noises.

## FLEXIBLE BUSHES

page 269

Power Transmission from 2,5 to 100 000 N.m allowing to absorb radial, axial and angular misalignment as well as couple irregularities.

## FLEXIBLE COUPLINGS

page 293

Power transmission from 2,5 to 100 000 N.m allowing to absorb radial, axial and angular misalignment as well as couple irregularities.

## DYNAMIC SEALINGS

page 344

Seals for rotating shafts. More than 2 000 references constantly evolving on materials and profiles, allowing to satisfy on industrial market requirements.

# 1 - INTRODUCTION

The reduction of noise and vibration has become very important :

- the need to improve operating conditions makes it essential;
- the increasing mechanisation of industrial and domestic equipment and appliances make it necessary;
- the lightness and increasing complexity of equipment demand it.

The following pages are dedicated to protection against vibration and shock. They offer design engineers the means to resolve isolation problems using elastomer alone or elastomer bonded to metal supports.

The first few pages start, therefore, with a summary of definitions and an explanation of the terminology used as well as the principal formula on which suspension calculations are based. The design of a flexible mounting system is a major undertaking and is the subject of a special section which gives the principles used to select a mounting system according to its size, characteristics, type and applications.

**Warning :** solving flexible mounting system problems very often requires the services of a specialist and we advise, very strongly, that if a simple solution cannot be found, then our technical services should be consulted.

### 2.1 - Flexible mounts

#### 2.1.1 - Properties

Flexible mounts are components which exhibit both flexibility and damping, at the same time and to varying degrees.

##### • Flexibility

- Flexibility is the ability of the mount to deform and recover, with an amplitude approximately proportional to the load.

##### • Damping

Damping is a braking force the most important effect of which is the reduction of oscillations.

There are essentially two types of damping :

- constant friction (dry friction) which, for a given setting, provides a constant braking force independent of the movement. For there to be movement, it is, therefore, necessary to apply a force at least as great as the frictional force;
- viscous damping (such as that provided by hydraulic dampers) which provides a braking force proportional to the instantaneous velocity of the suspended part relative to the fixed part. Viscous damping is, therefore, essentially dynamic: it does not affect the position of static equilibrium.

#### 2.1.2 - Environmental conditions

Most of the standard mounts are made of natural rubber which has been chosen because of its good dynamic properties. Under normal operating conditions, these rubber compounds guarantee stability over long periods and, in particular, limited creep.

The following operating conditions are considered abnormal :

- temperatures greater than 70°C;
- prolonged contact with corrosive liquids;
- prolonged contact with acids or alkalis;
- aggressive environment (oils, fuels);
- corrosive gases (ozone, chlorine...).

Using a mount unintentionally under such conditions can lead to premature ageing, degradation or even destruction of the rubber. An abnormally aggressive environment can, in particular, increase the deformation of the mounting (creep).

**PAULSTRA flexible mounts may be made using various special compounds that are highly resistant and able to withstand the abnormal conditions described above.**

**Our technical services are at your disposal to reply to any queries about the properties of particular compounds.**

#### 2.1.3 - Elastomeric flexible mounts

Mounts using natural or synthetic elastomers always provide a combination of pure elasticity and viscous damping. Although commonly used, the term "shock absorbers" is completely incorrect. The two characteristics, flexibility and damping, are, in fact, essentially different : a rubber mounting may be compared to a car suspension where the two functions are provided by different components working in parallel :

- true elastic suspension provided by springs;
- damping provided by hydraulic damping (shock absorbers).

A flexible mounting using rubber = a spring + a damper.

#### 2.1.4 - Characteristics of elastomeric flexible mounts

##### • Elastic properties

These are the parameters which define the ability of the mounting to be deformed in various directions.

- **The linear stiffness**  $K_x$ , along the axis  $G_x$  is the ratio of the force to the corresponding displacement along this axis. The linear stiffness is expressed by N/mm.

The linear stiffness ( $K_y, K_z$ ) for the other axes ( $G_y, G_z$ ) are defined in the same way.

- **The torsional stiffness** ( $C_x, C_y, C_z$ ) about the three axes ( $G_x, G_y, G_z$ ) is the ratio of the torque to the angular displacement about the axis.

The torsional stiffness is expressed in m.daN/rad.

These six parameters, which are not independent of each other for a given mount (the interdependence changes with the shape and structure of the mounting), are proportional to the Young's modulus of the elastomer used in the mounting.

Using these six values, it is possible to calculate the stiffness along or about any arbitrary axis.

##### • Damping properties

The most useful parameter is the "intrinsic damping factor" of the elastomer used. This will be defined for a suspension (§ 2.2.2). The intrinsic damping factor of a mount is the same as that of the suspension.

## 2.2 - Flexible mounting systems

A machine is suspended elastically by placing flexible mounts between the machine and its seatings (floor, slab, chassis, etc.). The type of mount, its number, distribution, positioning and individual characteristics, depend on the overall characteristics required by the suspension to give the desired result.

The most common problems are those where vibration determines the essential characteristics of the suspension. It is necessary, therefore, to start with a presentation of the terminology and a review of the most important definitions and principles.

#### 2.2.1 - Vibration theory concepts

A machine, suspended elastically, vibrates when it is subject to periodic alternate influences which produce oscillations of greater or lesser amplitude.

There are two main modes of vibration :

- natural or free vibration, which is the vibration of the machine that occurs when it is released after having been displaced from its position of equilibrium;
- forced vibration, which is imposed on the machine, either by its own operation, or by influences from its surrounding.

##### • Degrees of freedom

The number of degrees of freedom is the number of independent parameters which determine the position of the machine at any given time. Degrees of freedom of movement :

- linear movement parallel to a given axis (the independent parameter is the displacement along the axis),
- rotation about a given axis (the independent parameter is the angle of rotation about the axis).

##### • Vibrations with only one degree of freedom

The following discussion applies to vibrations with only one degree of freedom : a linear vibration parallel to a fixed axis.

##### • Periodic vibration

- Frequency : number of complete cycles in a unit of time.

N = number of cycles per minute.

n = number of cycles per second (Hertz).

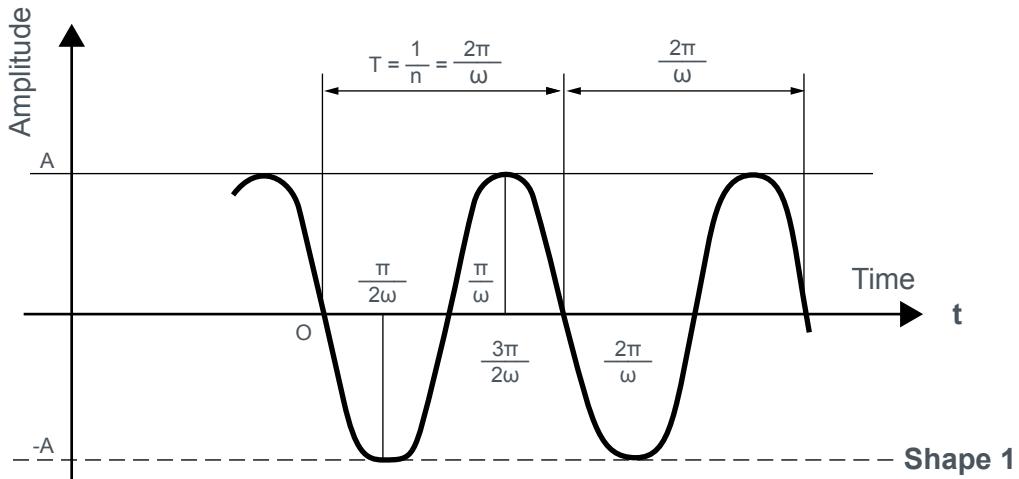

- Period : duration of one cycle.

$$T = \frac{1}{n} \text{ in second.}$$

$$\text{- Pulsation : } \omega = 2\pi n = \frac{2\pi}{T} \text{ in radians per second}$$

- Maximum amplitude : The maximum offset from the equilibrium position for each cycle. For a forced vibration under constant conditions, the amplitude remains constant.

- Sinusoidal vibration  $x = A \sin \omega t$  (shape 1)

$$- \text{Frequency } n = \frac{1}{T} = \frac{\omega}{2\pi}$$

- Amplitude A

- Maximum velocity V =  $A\omega$

- Maximum acceleration  $\Gamma = -A\omega^2$

- Instantaneous amplitude  $x = A \sin \omega t$

- Instantaneous velocity  $v = A\omega \cos \omega t$

- Instantaneous acceleration  $\Gamma = -A\omega^2 \sin \omega t$

High frequency vibrations (high  $\omega$ ) may, therefore, produce very high accelerations even at low amplitudes.

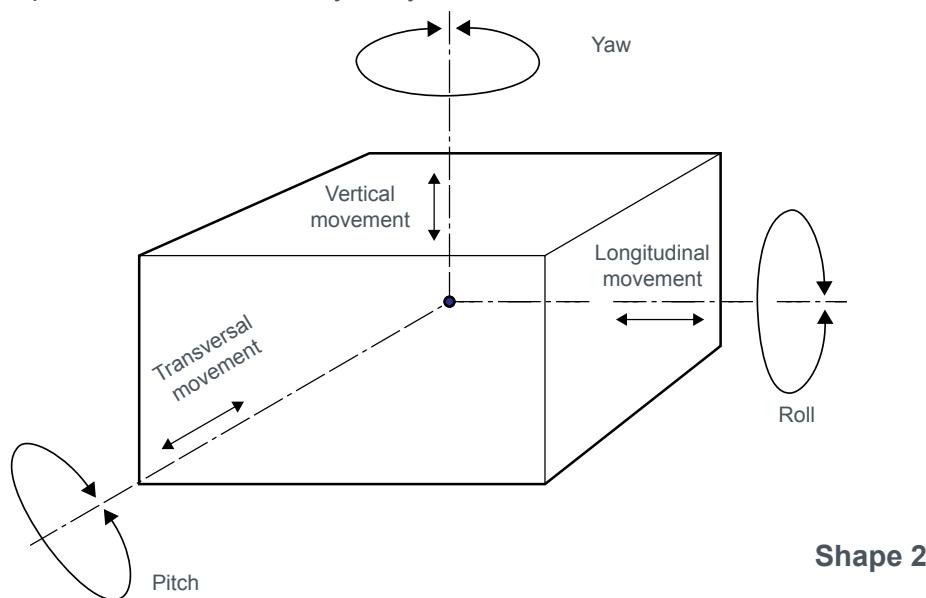

## 2.2.2 - Characteristics of flexible mounting systems

### • Elastic properties

These are the parameters which define the freedom of a machine to move with respect to its seating. The movements are, usually, referred to an axis system ( $G_x$ ,  $G_y$ ,  $G_z$ ).

In the example in shape 2 :

- the origin of the axis system is at the equilibrium position of the machine's centre of gravity;
- the axes are parallel to the axes of symmetry of the machine.

Shape 2

As for mounts, the stiffness of a suspension is defined for displacements with only one degree of freedom relative to a fixed set of axes.

### - Linear stiffness :

$K_x$  along  $G_x$  = longitudinal movement.

$K_y$  along  $G_y$  = transverse movement.

$K_z$  along  $G_z$  = vertical movement.

For each axis, the linear stiffness is the sum of the linear stiffness of all the mounts.

$$K_x = \sum K_x \quad K_y = \sum K_y \quad K_z = \sum K_z$$

### - Torsional stiffness :

$C_x$  about  $G_x$  = roll.

$C_y$  about  $G_y$  = pitch.

$C_z$  about  $G_z$  = yaw.

The torsional stiffness of the suspension depends on :

- the individual stiffness of the mounts;
- the position and orientation of the mounts with respect to the centre of gravity G of the machine.

### • Damping properties

Elastomers exhibit viscous damping, the braking force applied to an elastic suspension is  $R \times V$ , where : R is the resistance, V is the relative velocity of the suspended machine at time t.

If, starting with an undamped suspension, the damping is progressively increased (with all other factors remaining constant) the amplitude of the free oscillations, starting from a given initial offset, die away more and more quickly.

**The value of damping for which the return to the equilibrium position is asymptotic (without oscillation) is called the “critical damping” and is denoted by a resistance  $R_c$ .**

The damping factor  $\varepsilon$  is defined for a resistance R :

$$\varepsilon = \frac{R}{R_c} \quad (\varepsilon = 1 \text{ for critical damping}).$$

When suspension is subjected to forced vibrations at a frequency  $\omega$ , it has been shown that, for natural elastomers, the product  $\varepsilon\omega$  remains reasonably constant. This is equally true at the resonant frequency (see below).

$$\varepsilon \omega = \varepsilon_0 \omega_0 \text{ constant} \quad (\omega_0 \text{ is the resonant frequency}).$$

$\varepsilon_0$  being the damping factor at the resonance frequency.

It can be shown that  $\varepsilon_0$  is an intrinsic property of the elastomer used.

$\varepsilon_0$  = intrinsic damping factor.

$\varepsilon_0$  of a suspension =  $\varepsilon_0$  of each mounting (if all mountings use the same elastomer).

### • Electrical characteristics

Elastomers have an electrical resistance which varies according to their composition, hardness.

As a guide, the following values have been measured for our standard elastomers.

Natural Rubber : hardness  $45 \cdot 10^{13}$  Ohm x cm<sup>2</sup> /cm

hardness  $60 \cdot 10^6$  Ohm x cm<sup>2</sup>/cm

hardness  $75 \cdot 10^4$  Ohm x cm<sup>2</sup>/cm

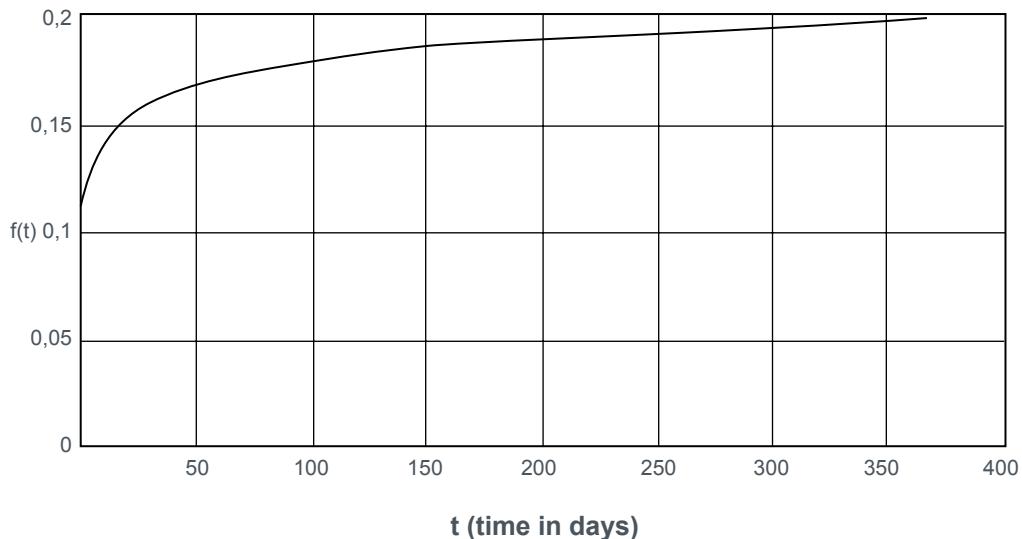

We have also developed special elastomers which can have a dielectric strength greater than 2,000 Volts for 1 minute.

### • Creep characteristics

The following formula, which is derived from measurements on samples, gives an estimate of the creep for a load which compresses a Radiaflex mount by 10% of its height at a temperature of 30°C. The creep for an actual mounting also depends equally on its shape.

Static deflection at time  $t$  = initial static deflection  $\times (1 + C_m \times f(t))$   
where  $f(t)$  is the value of the creep from the graph below:

**Creep  $f(t)$  in compression relative to the initial static deflection.**

and  $C_m$  is a correction coefficient taken from the table below according to the sample material :

Material	Hardness 45	Hardness 60	Hardness 75
Standard natural rubber	1.0	1.6	1.7
Polychloroprene	1.1	1.6	1.6

### Note

These values are given as a guide only. Consult us for use under other conditions (temperature, complex profiles or other elastomers).

### Mounting

For applications where alignment is important, to overcome the problems of initial creep of the elastomer mounts, adjustment to align the axes of shafts should be made at least two days after the machine has been mounted.

# 3 - FUNCTION OF A FLEXIBLE MOUNTING SYSTEM

## 3.1 - Static function

An elastic suspension allows the static load to be more evenly distributed.

If a machine rests on more than three points using "rigid" mountings, it is impossible to predict the load on each mounting point and the machine could be unevenly stressed.

With elastic mounts having a known stiffness, it is possible to determine (by calculation, or direct measurement) the deflection in each mounting and thus deduce the loading and correct any imbalance.

An elastic suspension accommodates minor differences in the distance between mounts. However many mountings there are, in order to avoid excessive local stresses, a rigid assembly requires very close tolerances on the distance between mountings and of the mating surfaces of the machine and its seatings.

To avoid prohibitively close manufacturing tolerances, "play" is allowed in the mount which gives rise to the well known problems of wear and noise due to loose fixings.

Flexible mounts allow larger manufacturing tolerances without large variation in forces.

An elastic suspension can also absorb small movements due to, for example, the expansion or the deformation of chassis, bodyshells, girders, etc.

## 3.2 - Dynamic function

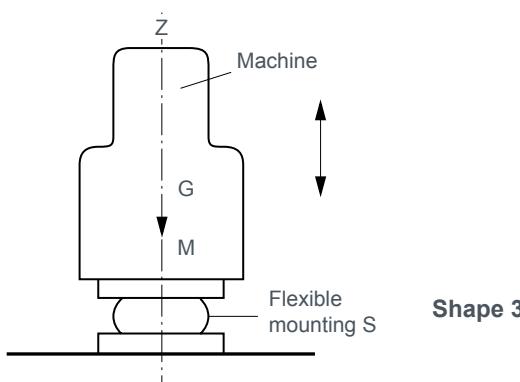

This is the primary function of elastic suspensions where there is vibration or shock. The calculations presented here assume that the linear stiffness of the mounts remains constant. This is true for elastomeric mountings in normal conditions of use (mechanical vibration, normal temperature).

### 3.2.1 - Vibrations with only one degree of freedom

The action of a flexible mounting system is very complex. To present the principles, we will study a simple idealised case (shape 3).

Taking the case of a machine of mass  $M$  constrained so that it can only move in a direction parallel to the vertical axis  $Gz$ .

It is attached to its seatings by a flexible mount  $S$  with a stiffness  $K$  along the axis  $Gz$ .

- Free oscillation (natural frequency)

a) Undamped (entirely theoretical)

The machine having been displaced from its position of equilibrium by a distance A oscillates sinusoidally.

The equation of motion is :  $z = A \sin \omega_0 t$

$$\text{The natural pulsation is } \omega_0 = \sqrt{\frac{K}{M}} \quad \text{Proper frequency } F_0 = \frac{\omega_0}{2\pi}$$

The oscillation continues indefinitely with an amplitude A (as shown in shape 1 with  $\omega$  replaced by  $\omega_0$ ).

b) Damped

In this case, the machine oscillates about its position of equilibrium with a damped sinusoidal motion (see shape 4). The equation of motion is :

$$z = A \cdot e^{-\varepsilon'_0 \omega'_0 t} \cdot \sin \omega'_0 t$$

The natural pulsation is :

$$\omega_0 = \sqrt{\frac{K}{M} (1 - \varepsilon'^2_0)} = \omega_0 \sqrt{1 - \varepsilon'^2_0}$$

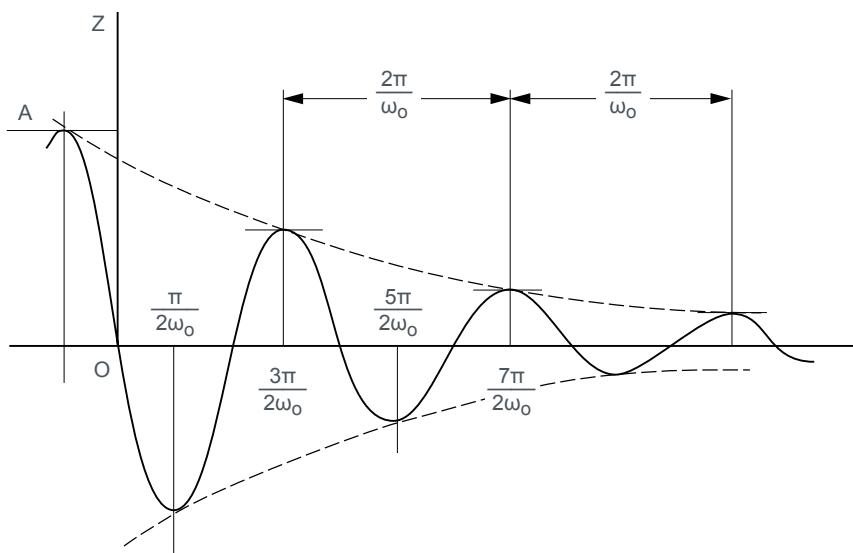

$\varepsilon'_0$  is the damping factor at the frequency  $\omega'_0$ .

As  $\varepsilon'_0$  is very close to  $\varepsilon_0$ , the natural frequency may, therefore, be written as :

$$\omega'_0 \approx \omega_0 \sqrt{1 - \varepsilon_0^2}$$

For natural rubber,  $\varepsilon_0$  is small by comparison with 1 (from 0.02 to 0.1).

$\omega'_0$  is, therefore, very close to  $\omega_0$ .

Shape 4

### • Forced vibration

If the machine is now subject to forced vertical vibration induced by a sinusoidal force of frequency  $\omega$ .

The inducing force is  $F = F_M \sin \omega t$ .

- For a rigid suspension : the inducing force is transmitted directly to the structure the machine is mounted on.

- For an elastic suspension with a natural frequency  $\omega_0$  or proper frequency  $F_p = \frac{\omega_0}{2\pi}$  and damping factor  $\varepsilon_0$  :

When the inducing force is applied, an oscillation is induced at the natural frequency  $\omega_0$  which dies away rapidly so that, after a short period, only the steady state forced vibration at frequency  $\omega$  remains which transmits a sinusoidal force to the surrounding structure.

The force transmitted is:  $F' = F'_M \sin \omega t$ .

A transmission coefficient  $\lambda$  is defined as the ratio between the amplitude of the force transmitted  $F'_M$  to the amplitude of the inducing force  $F_M$  (or, if preferred, the force that would be transmitted if the suspension was not elastic).

For a mounting system using elastomeric mounts, this coefficient is :

$$\lambda = \frac{F'_M}{F_M} = \sqrt{\frac{1 + 4 \varepsilon_0^2}{\left(1 - \frac{\omega^2}{\omega_0^2}\right)^2 + 4 \varepsilon_0^2}}$$

To summarize :

	Inducing force	Transmitted force	Transmission coefficient
Rigid system	$F = F_M \sin \omega t$	$F = F_M \sin \omega t$	$\lambda = 1$
Flexible system ( $\omega_0, \varepsilon_0$ )	$F = F_M \sin \omega t$	$F' = F'_M \sin \omega t$	$\lambda = \frac{F'_M}{F_M} = \sqrt{\frac{1 + 4 \varepsilon_0^2}{\left(1 - \frac{\omega^2}{\omega_0^2}\right)^2 + 4 \varepsilon_0^2}}$

The variations of the transmission coefficient  $\lambda$ , as a function of  $\frac{\omega}{\omega_0}$  for various values of  $\varepsilon_0$  are shown in shape 5 (page 12).

### Attenuation

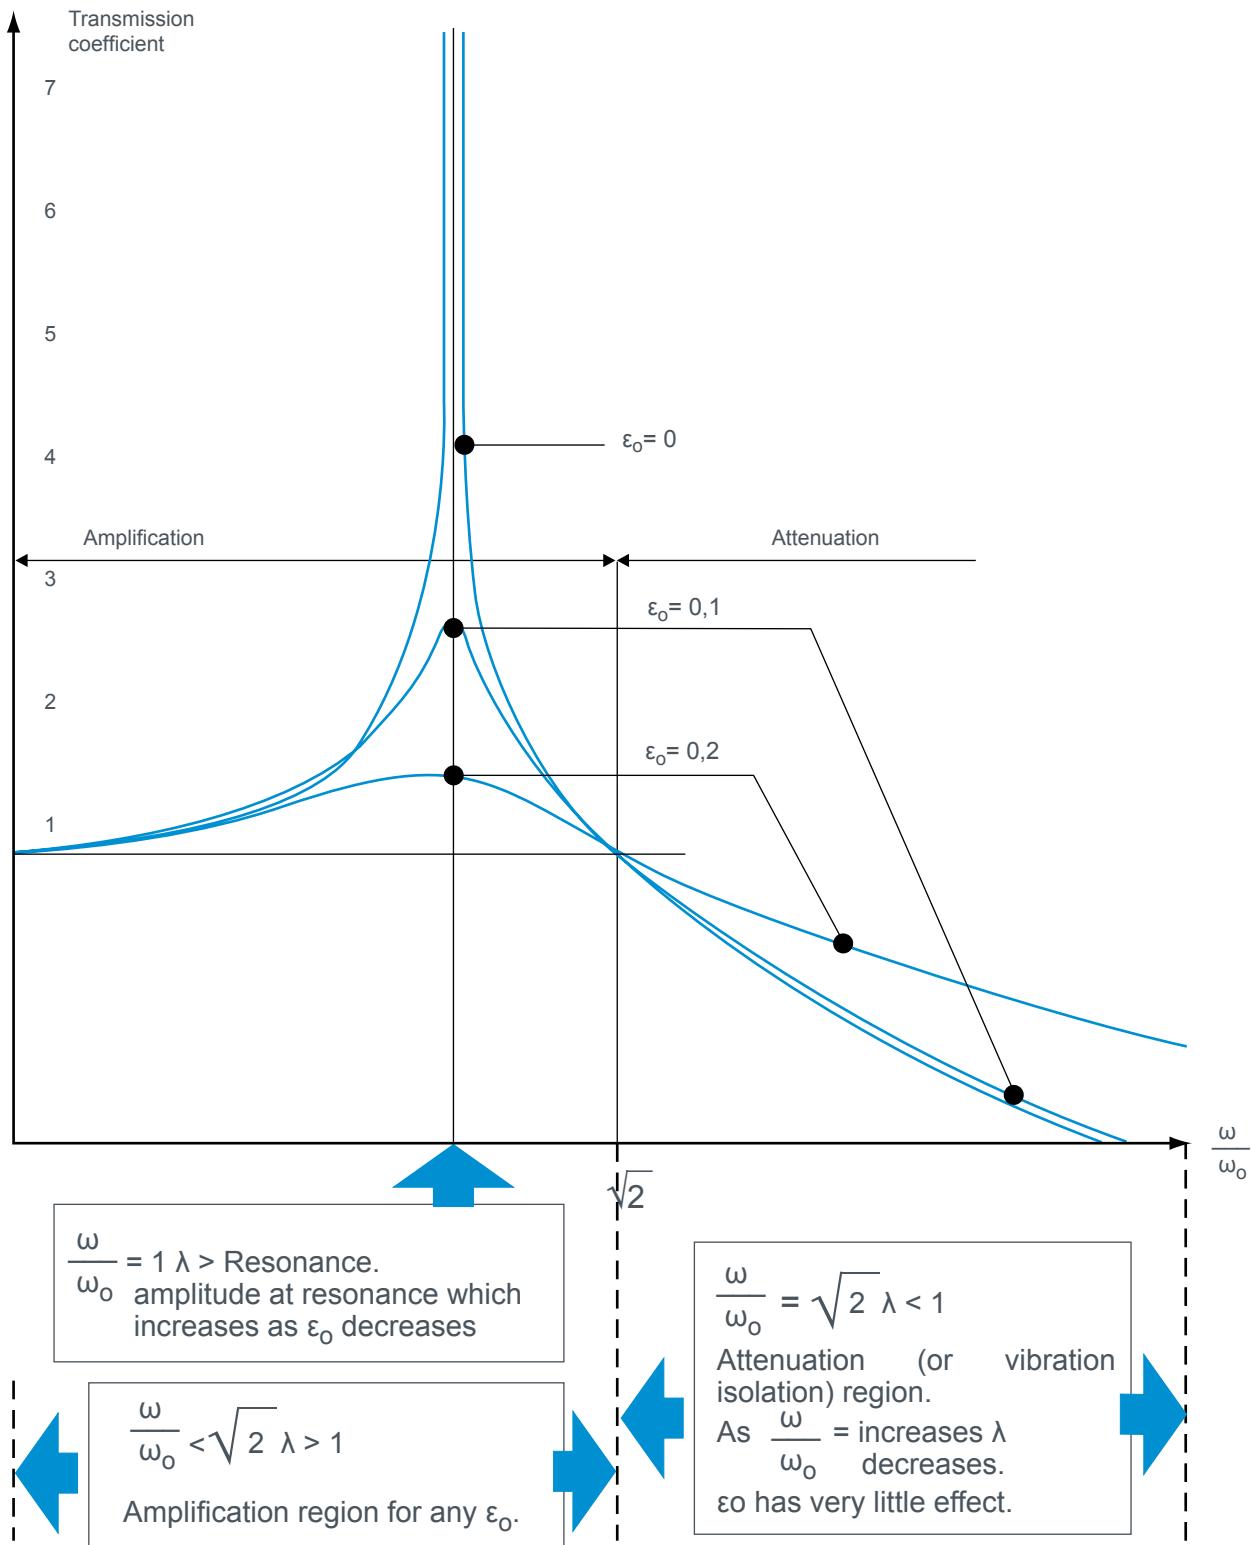

For rubber mountings, the term  $4 \varepsilon_0^2$  is much smaller than 1. The attenuation in % is  $1 - \lambda$  :

$$E \% = 100 \frac{\left(\frac{\omega}{\omega_0}\right)^2 - 2}{\left(\frac{\omega}{\omega_0}\right)^2 - 1} \quad \text{ou} \quad 100 \left(1 - \frac{1}{\left(\frac{\omega}{\omega_0}\right)^2 - 1}\right)$$

For a given induced frequency  $\omega$  the attenuation depends on the natural frequency of the suspension.

For a particular direction, the relationship between the natural frequency, the suspension's sub-tangent and the induced frequency are plotted on the chart shape 6.

For a particular induced frequency (for example 1500 rpm) it is possible to find the sub-tangent which will provide an acceptable attenuation. In general, an attenuation greater than 50% is required. For this example, the chart indicates that an attenuation of 80% will be achieved for a natural frequency of 10 Hz (see section IV.3.1).

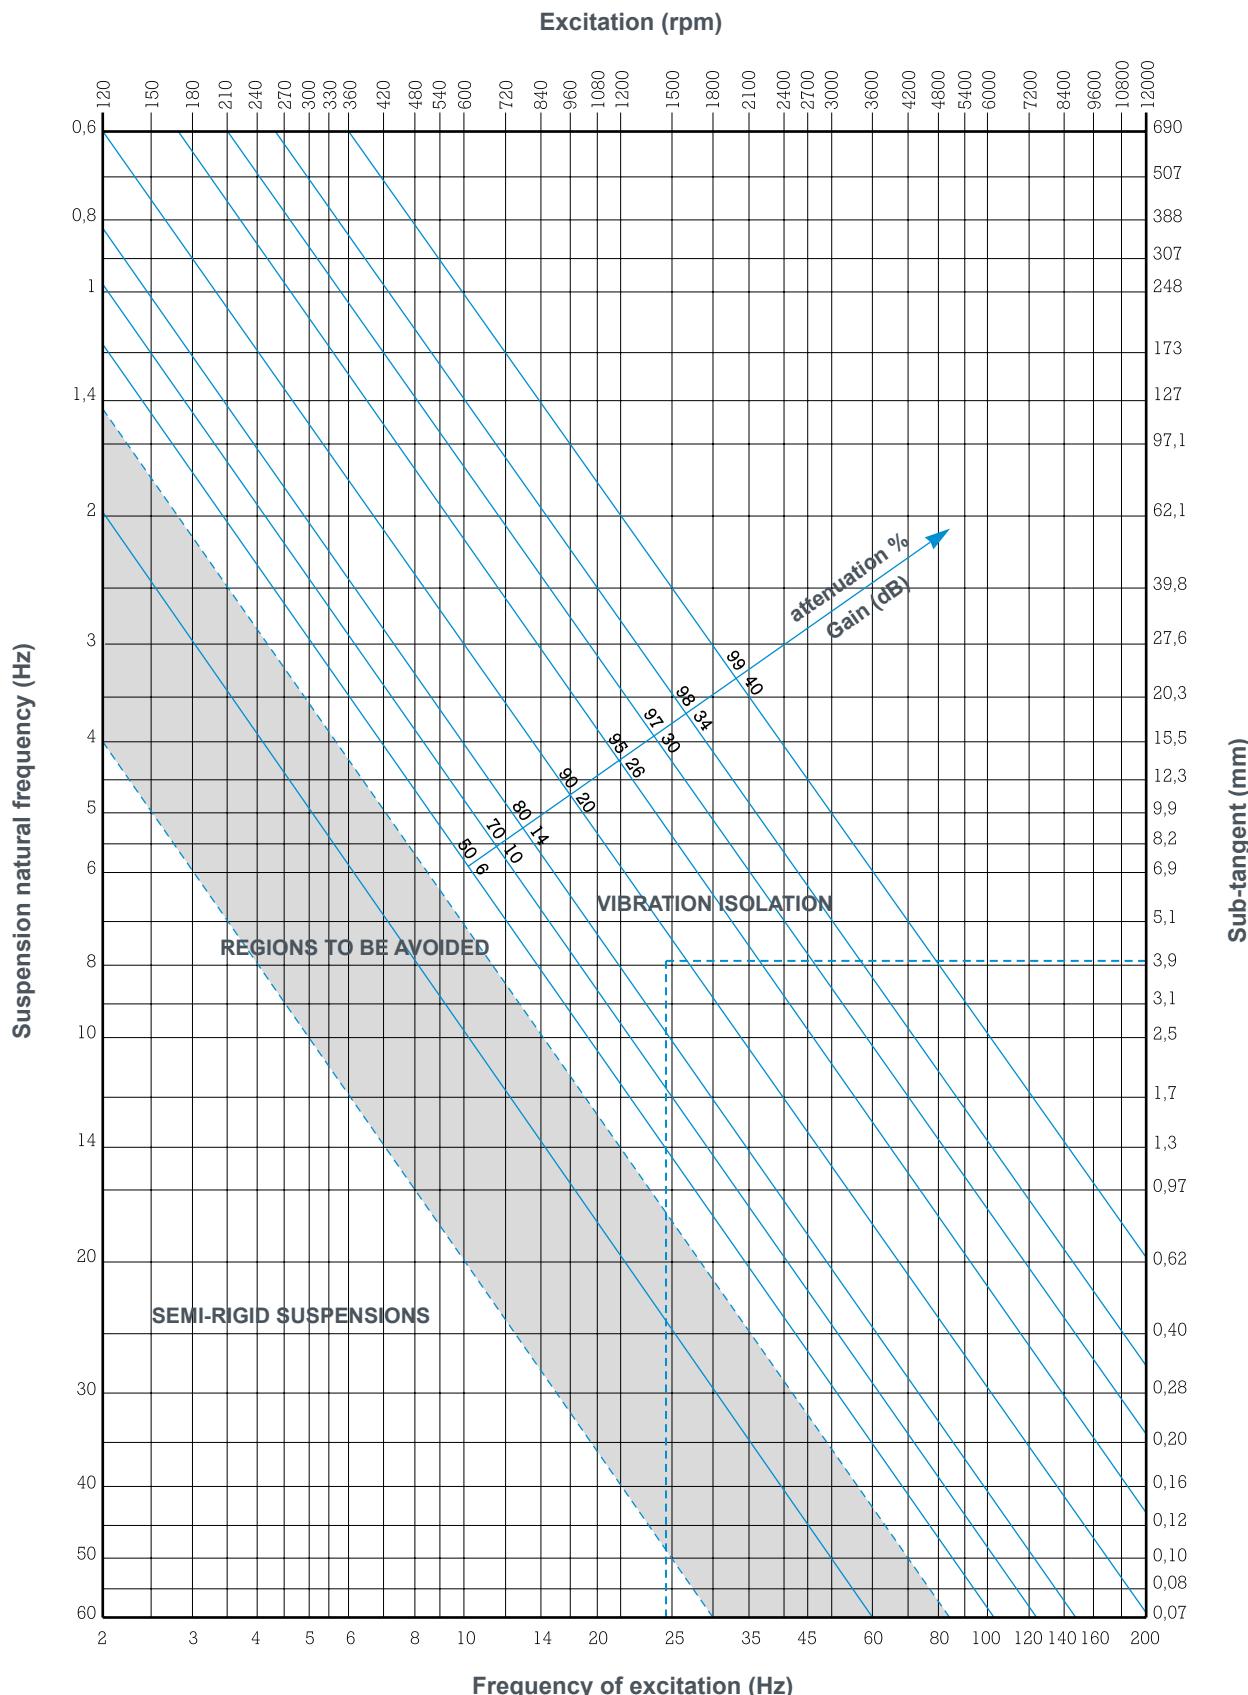

### Shape 5

An efficient mounting system use :

a high value of  $\frac{\omega}{\omega_0}$  → low values  $\omega_0$  → low values  $\lambda$   
 a moderate  $\epsilon_0$  → - limited amplification in the resonant region.  
 - minor effect in the attenuation region.

# ABAQUE

Attenuation as a function of natural frequency and frequency of excitation.  
(A theoretical graph for a mounting system without damping)

## ● Practical considerations

### a - Variable speed machines

In practice, there may not be a single, well defined value for  $\omega$ , as machines may have a variable speed (variable  $\omega$ ).

In these cases, the vibration isolation should be determined for the lowest speed.

### b - Passing through resonance

All machines must start and stop.

Starting from rest to reach the speed  $\omega$  (in the vibration isolation region), it is necessary to pass through the resonant region.

It is necessary to ensure :

- that the passage through resonance is as quick as possible;
- that the suspension is sufficiently well damped so that the maximum force transmitted presents no risk for the machine, the suspension or the seating.

### c - Elastomeric suspensions

For the elastomers currently used in flexible mounting systems, the intrinsic damping factor  $\varepsilon_0$  lies between 0.02 and 0.1 (it can be as high as 0.2 with synthetics such as butyl rubber).

In the vibration isolation region, the formula for the transmission coefficient is simplified as, for the values of  $\varepsilon_0$  for natural rubber, the term  $4\varepsilon_0^2$  is negligible by comparison with 1.

$$\lambda = \frac{1}{\frac{\omega^2}{\omega_0^2} - 1} \quad \text{For } \varepsilon_0 \text{ between 0.02 and 0.1}$$

$$\text{At resonance } \lambda_r = \frac{1}{2\varepsilon_0} \quad \lambda = \frac{1}{2\varepsilon}$$

For natural rubber, therefore, the amplification at resonance is between :

$$\frac{1}{2 \times 0,1} = 5 \quad \text{and} \quad \frac{1}{2 \times 0,02} = 25$$

### a) Noise and vibration

**Noise** is a random vibration. It is formed by the combination of a number of uncorrelated fundamental frequencies. Noise gives rise to **sound**.

Airbone noise is usually treated separately from structure borne noise.

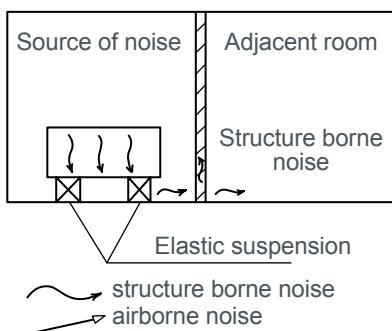

**Sound** is associated with the disturbance of a medium (solid, liquid or gaseous). This disturbance is in the form of a vibration of the molecules of the medium about their position of equilibrium.

### b) Improving acoustics

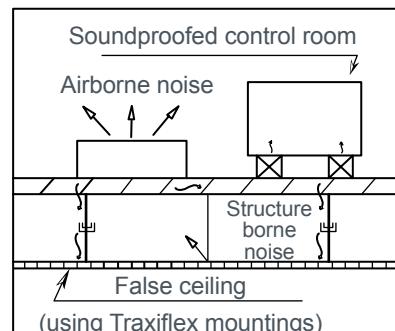

An elastic suspension affects only structure borne noise.

This is a vibration of the building structure and a flexible mounting system breaks the transmission close to the source. The resilience of the attachment reduces the forces transmitted to the base and its vibrational energy.

Transmission from one room to another

Example : Workshop with guillotine (shock and noise)

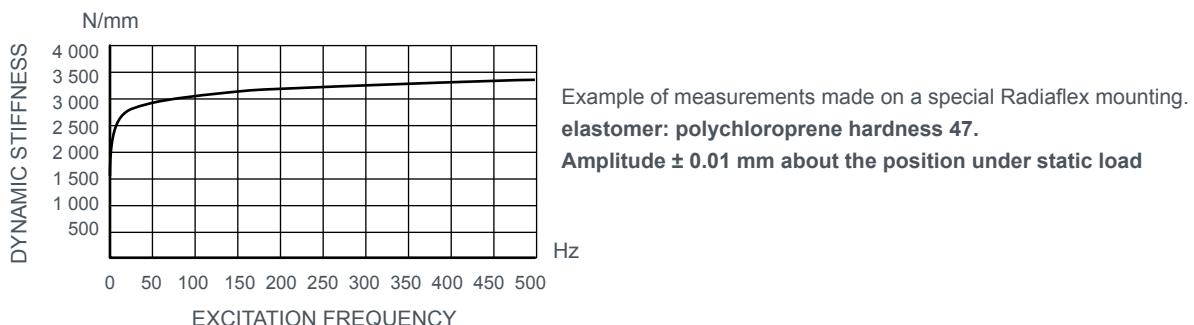

As the radiation efficiency is unchanged, the improvement in terms of radiated power (acoustic) is the same as the improvement in terms of the force transmitted. The curve giving the vibrational attenuation in % may be translated into decibels.

$$\text{Attenuation in dB is : } 20 \log \frac{100}{100 - E} \quad \text{where } E \text{ is the attenuation in \%}$$

(structure borne, not airborne noise).

The suspension of the machinery allows the **adjacent room** to be sound insulated and to be made more quiet. The rigidity of the base supporting the suspended mass must always be taken into account. As a rule, it is considered that unless the mountings are ten times more flexible than the base the choice of suspension must be re-considered.

PAULSTRA mountings may be characterised at high frequencies.

### 3.2.2 - SHOCK

#### • The nature of shock

For a given period, the equipment is subjected to a brief, impulsive excitation. It is the most severe type of excitation that it may encounter during its lifetime.

During the period that the excitation is applied, the speed of the equipment will vary : it is subject to acceleration and, therefore, to a force.

A system that reacts slowly will not be subject to the same shock as a system that reacts quickly. It is necessary to compare the length of period that the stimulus is applied, against the natural frequency of the equipment.

#### • Types of shock

In practice, there are two types of problems.

- the equipment is subjected to shocks which are well defined by experiments, but are very complex and not reproducible under laboratory conditions. It is, therefore, necessary to define an equivalent shock;
- the equipment must resist shocks which are arbitrarily defined (e.g. meeting standards). A shock is defined by an excitation which varies with time: the acceleration, the speed or the displacement of the point where the excitation is applied. In some cases, it is better to define the shock as the energy transferred to the equipment (e.g. vehicle impact).

#### • Protection against shock

There are two principal cases to be considered :

##### a) Limitation of the force transmitted to the equipment :

This case often appears in the following form : the equipment, moving at a known speed meets an obstacle. The force that it can withstand without damage is limited to a known value.

A system of rubber parts, which could be the flexible mounting system of the equipment, is placed between the equipment and the obstacle.

These parts provide a constant stiffness  $K_z$  in the direction of the shock. If there is energy  $W$  to be absorbed in the absence of damping:

$$W = \frac{1}{2} K_z Z^2 \quad \text{The maximum force } F_M = K_z Z = \frac{2W}{Z} \quad \text{The maximum force is inversely proportional to the travel.}$$

The travel  $Z = \sqrt{\frac{2W}{K_z}}$ . The travel is inversely proportional to the square root of the stiffness.

**Remarque :** some systems do not have a constant stiffness, but a stiffness which increases rapidly (e.g. compression systems). It is clear that if the energy  $W$  is not absorbed before the stiffness increases, the maximum force will be much higher than predicted by this formula.

### b) Limiting the acceleration of particular parts of the equipment

In this case the shock must be described in terms of its potential to destroy. The efficiency of the protection system is measured by its ability to reduce this potential. A shock to the equipment can damage a component part if this part is induced to vibrate at an amplitude which is incompatible with its mechanical characteristics thus causing it to break.

A shock can be characterised by its action on a whole series of components.

For the same shock, each component has its own specific response, which differs from one component to the next.

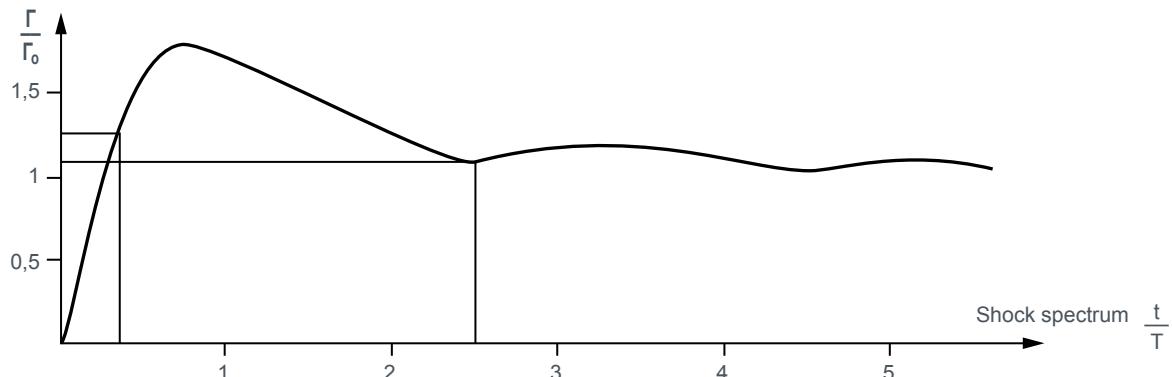

The shock spectrum is the graphical representation of the ratio of amplitude of vibration ( $\Gamma$ ) of the components to the amplitude of the shock ( $\Gamma_0$ ) as function of the ratio of the duration of the shock  $\tau$  to the natural frequency  $T$  of the elements.

This is not a representation of the amplitude as a function of time, neither of the excitation nor of the effect, but a convenient representation of the destructive power of a shock.

The representation is not reversible :

- it is not possible to recover the form of the shock from the spectrum;
- two different shocks may well produce the same spectrum.

Take, for example, the case of shock with a semi sinusoidal acceleration.

A piece of equipment must withstand a shock of  $\Gamma_0 = 400 \text{ m/s}^2$  for a period  $t = 8.75 \times 10^{-3} \text{ s}$ .

	Component A of the equipment	Component B of the equipment
Natural frequency mass	40 Hz 10 kg	286 Hz 1 kg
$\frac{\tau}{T}$	$8.75 \times 10^{-3} \times 40 = 0,35$	$8.75 \times 10^{-3} \times 286 = 2,5$
$\frac{\Gamma}{\Gamma_0}$	1,25	1,1
Load on mounting points	$400 \times 1,25 \times 10 = 5000 \text{ N}$	$400 \times 1,1 \times 1 = 440 \text{ N}$

Study of the spectrum shows that the performance of a mounting system is acceptable when it is possible to obtain a natural frequency  $T$  such as:

$$\frac{\tau}{T} < \text{ in which case the ratio } \frac{\Gamma}{\Gamma_0} \text{ is less than 1 and the component is protected.}$$

If it is not possible, it is better to set up the flexible mounting system to avoid the region of significant amplification for:

$$\frac{\tau}{T} \text{ between 0.25 and 2.5}$$

This simple case shows the role of a flexible mounting system and the importance of knowing the details (shock spectrum, amplitude as a function of time) and, above all, the duration of the shock.

#### • The role of damping

Damping can be useful in reducing rebounds and the amplitude of successive cycles of oscillation. It is, however, important not to use just any type of damping as some can give rise to unfortunate reactions. Elastomers provide a compromise which allow the provision a high level of protection.

- **Important note**

Two points must always be borne in mind when designing equipment:

Firstly, that a high level of protection requires great flexibility which requires considerable clearance between the equipment and its surrounding;

Secondly, that the equipment will oscillate and room must be allowed for the rebound in case of shock. Travel limiters must be positioned so that they do not impede the operation of the flexible mounting system during the shocks allowed for in the design.

A flexible mounting system using rubber protects against shock by reducing the travel and maximum force. It is necessary to allow enough clearance for the rebound.

### 3.2.3 - General case

Theoretical study above is based on a very simple case:

movement with only one degree of freedom (vertical) with only one excitation (also vertical) aligned with both the centre of gravity of the suspended machine and the centre of elasticity of the mounting system.

In general, things are not so simple. The machine can move in any of the degrees of freedom (rotation or linear movement). In theory, there are as many **natural frequencies** as there are degrees of freedom.

These natural frequencies are not independent but are “coupled”. If one of these is excited in one degree of freedom, it can, as a result of the **coupling**, give rise to vibrations at the same frequency in other degrees of freedom.

To analyse the whole behaviour, the **stiffness** in all directions needs to be taken into account and not just the mass of the suspended body but also the **moments of inertia** so that rotational behaviour can be evaluated.

In addition there may be not one but several forced vibrations with variable frequencies applied to several different points, in various directions or about various axes.

Even general cases can be very complex however symmetrical structures and mounting arrangements allow the use of the single degree of freedom analysis shown above. In other cases only an in-depth study allows an effective solution to be found. Our Technical Services are there to help you to define it.

## 3.3 - Various types of flexible mounting systems

### 3.3.1 - Active isolation system

This is a flexible mounting system designed to prevent a machine from transmitting its vibrations to its seating or foundation.

This is the theoretical problem (with one degree of freedom), which was treated by attenuating the vibration, in the preceding pages.

**The vibration isolation does not stop the machine from vibrating, but it reduces the transmission of these vibrations.**

By comparison with a rigid suspension (which transmits the vibrations), the amplitude of the machine's vibrations may be greater. The machine is, to an extent, freed from its fixed seating. This is the case for the automobile “floating engine” which, mounted on a flexible mounting system, no longer transmits its vibrations to the bodywork and the passengers due to increased mobility under the bonnet (hood).

If excessive movement cannot be tolerated, the only way to reduce it, without reducing the efficiency of the flexible mounting system, is to increase the suspended mass (ballasting). For a given excitation, the amplitude is inversely proportional to the mass.

This is necessary for certain machines which produce particularly severe vibration: slow single cylinder compressors, centrifuges, power hammers etc.

These machines, are therefore, rigidly fixed to a chassis or heavy slabs and the whole assembly is suspended.

Increasing the suspended mass allows good vibration isolation with limited vibration of the suspended assembly.

It is worthwhile suspending complete assemblies rather than individual machines: generating sets, motor/compressor units, motor/pump units.

### 3.3.2 - Passive isolation system

This is a flexible mounting system designed to protect a non-vibrating machine from the vibrations of its surroundings.

The design of a flexible mounting system for attenuating vibration, as defined above, is still valid. With the correct flexible mounting system, the acceleration transmitted to the machine is very small and as it is not subject to any other excitation it remains almost stationary.

The vibration of the supporting structure is almost entirely absorbed by the flexible mounts.

### 3.3.3 - Semi-rigid mounting system

This is a suspension where there is no vibration isolation for a given frequency  $\omega$

$$\left( \frac{\omega}{\omega_0} < \sqrt{2} \right)$$

As shown above, such a mounting system should be of no interest as it leads to an amplification of the vibration, not an attenuation. In practice, it can, however, give reasonable performance in the following two cases.

- Coupling

In practice, there is not just one movement. For a mounting system, several movements are possible. In fact, as we have seen (shape 2), a machine may have six degrees of freedom. A proper study of a mounts system will take into account the type of excitation acting on the machine and try to arrange that it does not vibrate in all directions. However, because of constraints on mounting points, the mounts may not always be put in ideal positions: if the machine is subject to an excitation in one direction, it may, therefore, move in several directions, e.g. two. These two movements are said to be "coupled".

The natural frequencies in each direction are not identical. The coupling between the two movements has the effect of lowering the lower natural frequency and raising the higher. Instead of having one maximum (shape 5), the response curve has two. It is essential the excitation does not fall on one or the other. As it may demand an impossibly high flexibility, it is not always possible to make the coupled natural frequencies sufficiently low to put the frequency of the excitation in the vibration isolation region. On the other hand, if the two natural frequencies are placed on either side of the frequency of the excitation, a modest attenuation may be obtained.

- Harmonics

A vibration of frequency  $\omega$  is rarely "pure". Frequently it also includes "harmonics"; i.e. vibrations at related frequencies  $2\omega$ ,  $3\omega$  ... Even if it is not possible to provide vibrational isolation of the fundamental  $\omega$ , it may be possible to attenuate the harmonics. This may be more important as the low frequencies are often inaudible and, in addition, correspond to very small mechanical accelerations whereas the higher frequencies are a source of noise which can be eliminated by an appropriate vibration isolator.

### 3.3.4 - External connections

So far, it has been assumed that the machine is only connected to its surrounding by its flexible mounting system.

In practice, there will be other connections, such as :

- pipework (inlet, exhaust, cooling);
- electric cables, remote controls...

It is necessary to ensure, or arrange, that these external connections are sufficiently flexible with respect to the relative movements.

This precaution will avoid :

- damage to pipework.
- reduced vibration isolation by introducing additional rigidity.
- direct transmission, via these connections, of the vibrations which have been suppressed elsewhere.

As the flexible mounts attenuate the transmission of the vibrations the machine is free to move, be sure to leave enough clearance in all directions to allow freedom of movement.

# 4 - DESIGNING A FLEXIBLE MOUNTING SYSTEM

When designing a flexible mounting system, it is essential to know, precisely the basic characteristics of the machine to be suspended.

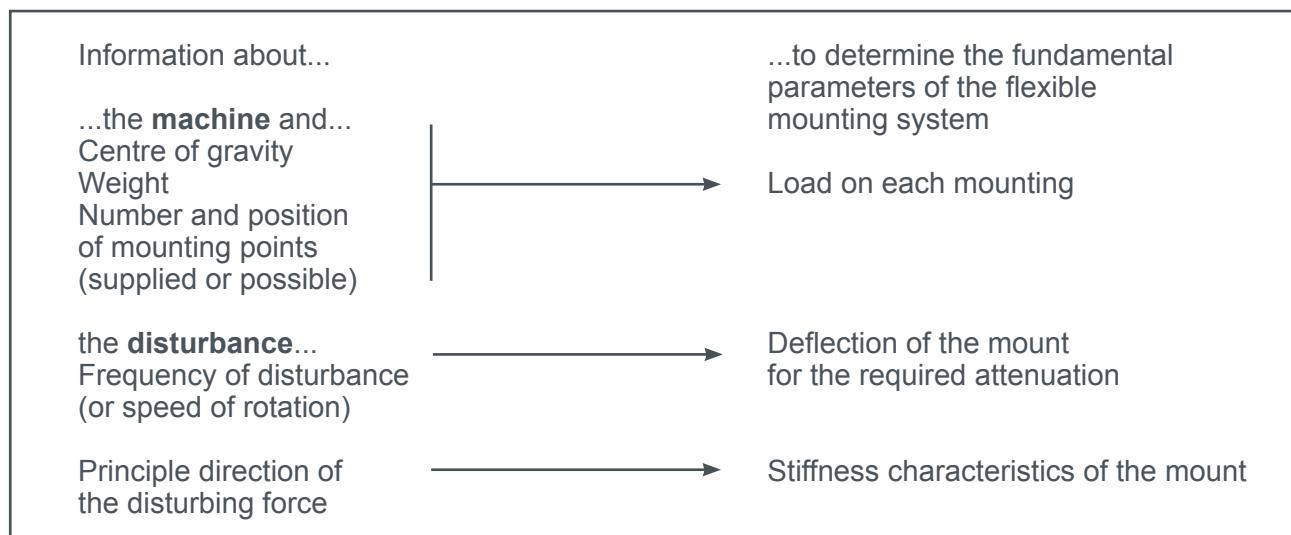

It is extremely useful to have a drawing (even if it is schematic) which shows the position of the centre of gravity and the mounting points provided.

The drawing may also allow the evaluation of certain parameters which may be necessary and which are often unknown to either the manufacturers or the users (e.g. moments of inertia).

For passive isolation, it is necessary to obtain the maximum of information about the external vibrations which may disturb the machine.

In any case, for complex problems (oscillations in many degrees of freedom, multiple excitation), it is advisable to consult our Technical Services.

For simple problems (one degree of freedom, or two degrees of freedom with the centre of gravity close to the mounting plane) it is possible to design the suspension, as shown below, with a minimum of information about the machine and the disturbance.

## 4.1 - Determining the centre of gravity

### 4.1.1 - Ask the manufacturer

In most cases, the manufacturer of the machine should be able to supply the exact position of the centre of gravity as well as the weight.  
Consult the manufacturer.

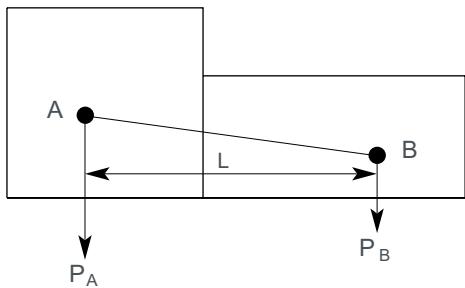

### 4.1.2 - Graphical method for finding the centre of gravity of an assembly

This is suitable for assemblies of units for which the individual weights and centres of gravity are known.

#### Important notes

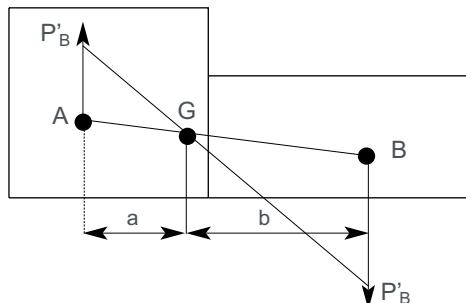

- Using a graphical method, it is important to represent dimensions using a well determined scale and the weights by vertical lines whose lengths are proportional to their size (e.g. 1 cm for 10 daN).
- If the centres of gravity considered in this section are not in the same vertical plane, the procedures proposed here should be applied twice: for the front and for the side view with the outlines corresponding to each view.

- An assembly of two units

**Shape 7**

Two units of weights  $P_A$  and  $P_B$  respectively with centres of gravity A and B separated by L.

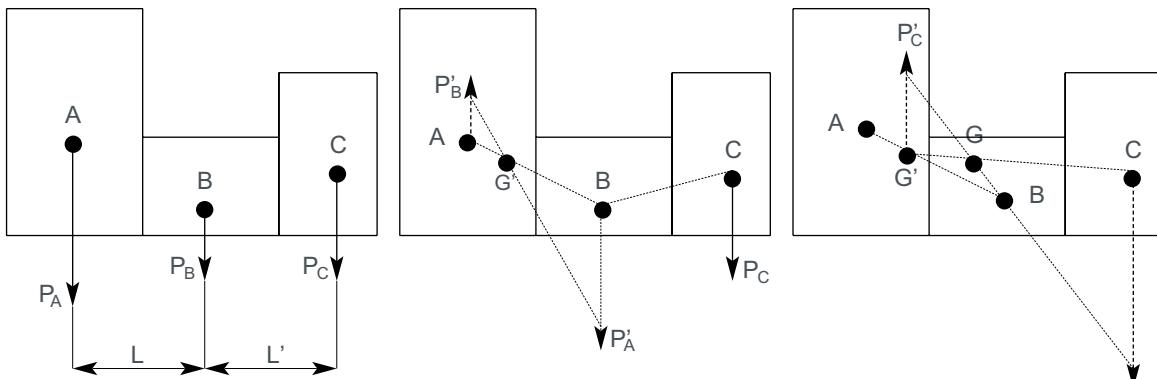

**Shape 8**

Draw :  $AP'_B = BP_B$       Join  $P'_A$  and  $P'_B$   
 $BP'_A = AP_A$   
The centre of gravity G lies at the intersection of the lines  $P'_A$   $P'_B$  and AB. Measure a and b.

- An assembly of three or more units

Proceed, stage by stage, as described above using groups of two units or sub-assemblies with centres of gravity and weight known or calculated.

**Shape 9**

#### 4.1.3 - Experimental determination of the centre of gravity of a unit

This method is used where the above two methods prove to be impossible or difficult (complex geometry).

- Using a roller

For a given orientation (length, width and height) the centre of gravity is in the vertical plane passing through the axis of the roller when the machine is balanced. The centre of gravity is at the intersection of the three planes thus determined.

- By «hanging»

Suspended from a cable, the centre of gravity is on the vertical dropped from the suspension point. To find the exact centre of gravity, repeat the operation twice, using a different suspension point each time.

#### 4.1.4 - Analytical determination of the centre of gravity of an assembly of several masses

An assembly of several masses  $m_1, m_2, \dots, m_n$  is fixed in space.

It is assumed that the coordinates, within an arbitrary Cartesian set, of each mass are known.

$$m_1 \begin{cases} X_1 \\ Y_1 \\ Z_1 \end{cases}$$

$$m_2 \begin{cases} X_2 \\ Y_2 \\ Z_2 \end{cases}$$

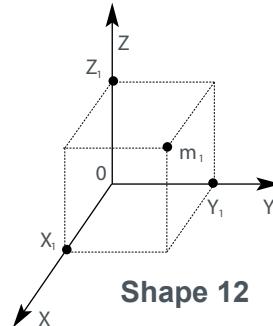

$$m_n \begin{cases} X_n \\ Y_n \\ Z_n \end{cases}$$

The mass of the assembly  $M = m_1 + m_2 + \dots + m_n$  acts at the coordinates of the centre of gravity of the whole :  $x, y, z$ .

$$x = \frac{m_1 x_1 + m_2 x_2 + \dots + m_n x_n}{M}$$

$$y = \frac{m_1 y_1 + m_2 y_2 + \dots + m_n y_n}{M}$$

$$z = \frac{m_1 z_1 + m_2 z_2 + \dots + m_n z_n}{M}$$

**Important note :** The coordinates of the centres of gravity may be negative and must be used with their sign.

## 4.2 - Determining the load per mount

### 4.2.1 - Number and position of the mounting points are not predetermined

In this case, the number and position of the mountings are determined in such a way that the load on each mounting is the same for all mounting points.

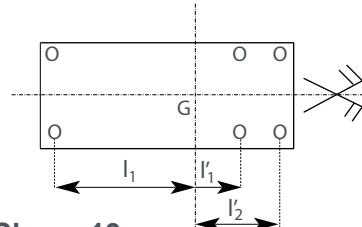

Taking, for example, a symmetrical machine with :

G : the centre of gravity,

P : the weight of the machine.

Calculate the position of 6 mounting points such that the load on all the mounting points is  $P_1$ .

$$P_1 l'_1 + P_1 l'_2 = P_1 l_1$$

$$\text{from which } l_1 = l'_1 + l'_2 \text{ and the load per point} = \frac{\text{Weight}}{6}$$

### 4.2.2 - Number and position of the mounting points are predetermined

In this case, it may not be possible to have the same load on each mount.

#### • Four mounting points

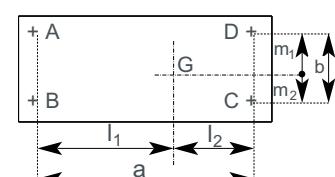

A, B, C and D are the mounting points.

G the centre of gravity

P the total weight suspended

$P_A, P_B, P_C$  and  $P_D$  are the load on the mounting points A, B, C and D.

$$P_A = \frac{m_2}{b} \cdot \frac{l_2}{a} \cdot P \quad P_B = \frac{m_1}{b} \cdot \frac{l_2}{a} \cdot P$$

$$P_C = \frac{m_1}{b} \cdot \frac{l_1}{a} \cdot P \quad P_D = \frac{m_2}{b} \cdot \frac{l_1}{a} \cdot P$$

If  $P_A, P_B, P_C$  and  $P_D$  are significantly different, it is, theoretically, necessary to choose four different mounts which will give the same deflection under the various loads.

- More than four mounting points (shape 15)

In this case it is best if the assembly is symmetrical about a vertical plane. This is assumed to be true in the following.

To the left of G, there are  $2n$  identical mounts.

To the right of G, there are  $2p$  identical mounts which are, possibly, different from the  $2n$  mounts to the left.

The problem is to set the difference between the left hand and right hand mounts so that the deflection under load of the  $2n + 2p$  mounts are all the same.

Under these conditions, all the mounts to the left of G will be supporting the same load Q and all those to the right will be supporting the same load R.

This will give :

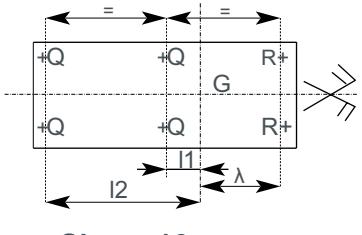

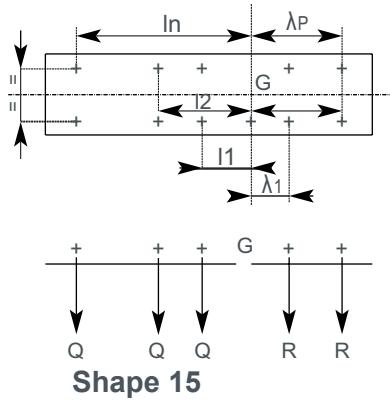

$$Q(l_1 + l_2 + \dots + l_n) = (\lambda_1 + \lambda_2 + \dots + \lambda_p)$$

$$2nQ + 2pR = P$$

From which the mounts load is:

$$Q = \frac{\lambda_1 + \lambda_2 + \lambda_p}{2n(\lambda_1 + \lambda_2 + \dots + \lambda_p) + 2p(l_1 + l_2 + \dots + l_n)} \cdot P$$

$$R = \frac{l_1 + l_2 + \lambda_p}{2n(\lambda_1 + \lambda_2 + \dots + \lambda_p) + 2p(l_1 + l_2 + \dots + l_n)} \cdot P$$

If Q and R are not too different, the same size mounts may be used but with different hardness elastomers.

Example (shape16)

Taking a symmetrical machine with an offset centre of gravity G and 6 mounting points  $n = 2$  et  $p = 1$ .

which gives :

$$Q = \frac{\lambda}{4\lambda + 2(l_1 + l_2)} \cdot P$$

$$R = \frac{l_1 + l_2}{4\lambda + 2(l_1 + l_2)} \cdot P$$

If the machine weighs 500 daN

and  $\lambda = 0.4$  m;  $l_1 = 0.3$  m;  $l_2 = 0.9$  m, then  $Q = 50$  daN and  $R = 150$  daN.

#### 4.2.3 - Important notes

If a single size of mount is used but different hardness elastomers are chosen, there is a high risk that the mount may be interchanged which may degrade the attenuation of the suspension. The machine must be mounted with great care.

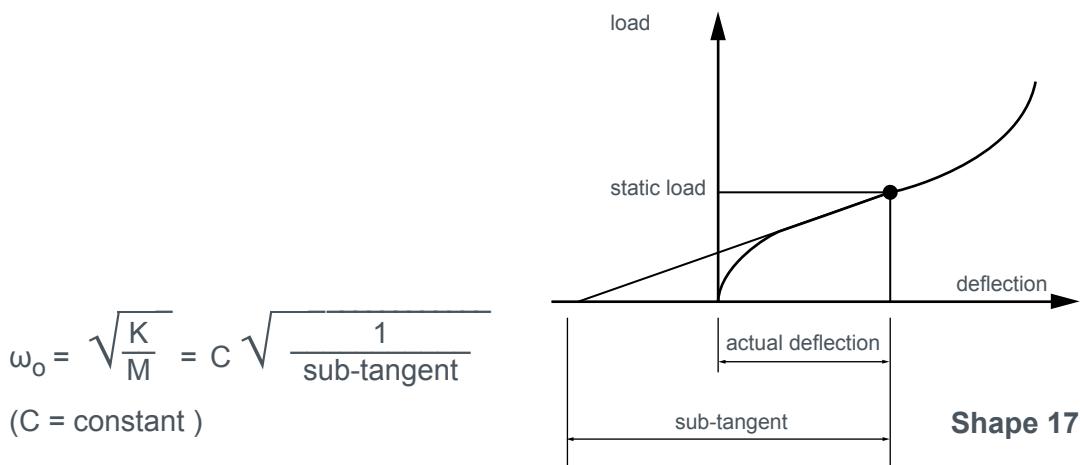

There are, however, benefits from using identical mounts to build a suspension. If the predetermined mounting points of the chassis do not allow a centered suspension, the solution is to attach these to a false chassis, as rigid as possible, to which the desired number of identical flexible mounts are attached in the positions required. If this false chassis is a slab of concrete (or inertia block) the suspended mass is increased which improves the quality of the suspension.

## 4.3 - Determining the deflection

### 4.3.1 - Deflection and sub-tangent

Shape 17 is a graphical representation of the derivation of the deflection and sub-tangent from the load-deflection curve.

For a given static load, the deflection corresponds to the compression of the mount under that load, but the stiffness about the position under load is given by the sub-tangent (the projection of the tangent onto the axis). This is the elasticity which determines the natural frequency of the mounting.

For most PAULSTRA mounts, the load/deflection curve is linear in the region of static loads and, as a result, the sub-tangent and the deflection are identical.

The curve in shape 17 is typical of EVIDGOM mounts.

For these it is best to work at the point of inflection of the curve where the sub-tangent is the largest possible and so the natural frequency is as low as possible.

**The deflection does not indicate the amplitude of the oscillations of the machine.**

### 4.3.2 - Operating regions

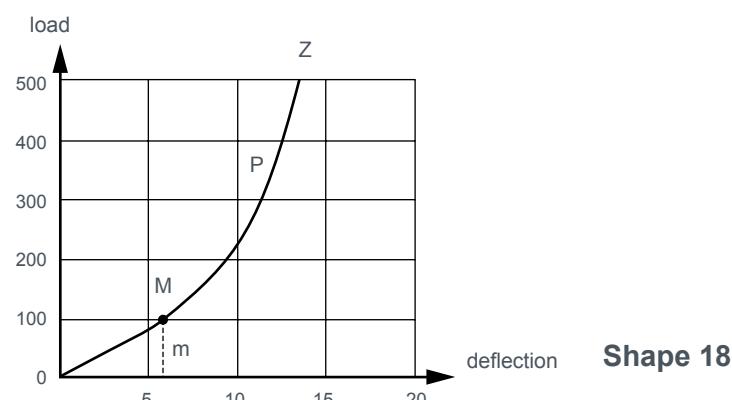

The region OM is the static load region. The deflection is approximately proportional to the load.

**In the data sheets, the coordinates of the point M are given as the NOMINAL STATIC LOAD.**

The region MP is the dynamic load region corresponding to normal, repeated shocks provided that the rate and total deflection stay within normal limits.

In the region PZ, which corresponds to exceptional, accidental shocks, the curve rises rapidly.

The stiffness increases progressively which has the effect of reducing the amplitude of the movement. Note that, because of the natural damping properties of the rubber, this increase also depends on the speed of impact.

### 4.3.3 - Attenuation - excitation frequency

At a given excitation frequency  $\omega$ , the attenuation depends on the natural frequency  $\omega_0$  and thus the sub-tangent. With most rotating machinery, the excitation frequency in cycles per minute can be taken to be the rotation speed in rpm.

As indicated on the chart in § 3.2.1 for a natural frequency in a known direction, the aim is to obtain the highest possible attenuation within the constraints of the load / deflection characteristics of the mounts.

The deflection selected must not be so high as to be detrimental to the stability of the suspension. If the operating point is not within the vibration isolation zone, our technical services should be consulted.

### 4.3.4 - Static stiffness - dynamic stiffness - natural frequency

Whereas deflection and sub-tangent are given by the static stiffness curve of the mounting, its natural frequency is linked to the dynamic stiffness. In the case of elastomeric mountings, static and dynamic stiffness can be different.

The ratio between static and dynamic stiffness depends on the input amplitude, the frequency and the type of elastomer. Under nominal load, the natural frequency is given for indication only.

For a different load, the natural frequency could be found with the following formula:

$$f_0 \text{ (actual load)} = f_0 \text{ (nominal load)} \times \sqrt{\frac{\text{nominal load}}{\text{actual load}}}$$

This approximate is valid only if the actual load is in the linear part of the load/deflection curve (shape 17 & 18).

## 4.4 - Design examples

PAULSTRA mounts are classified according to their stiffness characteristics

Therefore, after having determined the number and deflection of the mountings as described above, the choice of mounts depends on the direction of the excitation.

- equi-frequency mounts : the flexibility is approximately the same vertically as horizontally;
- mounts with high axial flexibility : high axial flexibility while supporting radial loads;
- mounts with high radial flexibility : high radial flexibility while supporting axial loads;
- low frequency mountings : high sub-tangent to achieve a very low natural frequency (a few Hertz).

### 4.4.1 - Suspension for a fan

#### • Characteristics of the equipment

- Weight : 3000 daN.
- Speed of rotation : 1200 rpm.
- Fan mounted on a 2.5 x 3m chassis with no constraint on the position of the mounting fixing points.
- Known centre of gravity.

Number of mounts : after trials, using successive approximation to balance the moments of inertia, 12 mounting points were selected.

Load per mounting =  $3000/12 = 250$  daN.

Natural frequency of the mounts (see chart).

For an input frequency (or speed of rotation) of 1200 rpm, the maximum natural frequency is 14 Hz. A natural frequency of 7 Hz will achieve a reasonable attenuation of about 85%.

Therefore, a mounting system with a natural frequency of 7 Hz under 250 daN is required.

As it is a rotating machine with no special characteristics, isometric mountings are selected.

The selection guide gives a PAULSTRADYN mount with a 8 mm deflection under a 260 daN load. According to the data sheet for PAULSTRADYN mounts, the PAULSTRADYN Ø 100 hardness 60 has a deflection of 7.4 mm under a load of 240 daN, which is just right.

#### • Suspension characteristics:

- 12 PAULSTRADYN 260. Mount part number 533712.

- Attenuation ~ 85%\*.

$$\text{- Ratio} = \frac{\text{real load}}{\text{nominal load}} = \frac{250}{260} = 0.96$$

- Loaded height ~ 32.5 mm\*.

\*These values are given by the Paulstradyn data sheet.

#### 4.4.2 - Suspension of an engine/hydraulic pump unit mounted on an excavator

- **Characteristics of the assembly**

- Weight: 1200 daN.
- Speed of rotation : 1500 rpm.
- Known centre of gravity.
- 6 mounting points.

Load per mounting :  $1200/6 = 200$  daN.

Deflection (see chart, shape 5).

For a frequency of 1500 rpm, a deflection of 3 mm will achieve an attenuation of approximately 85%.

The vibrations are predominantly vertical and the unit needs to be restrained laterally to cope with the movement of the excavator in operation. Mountings with dominant axial flexibility are selected.

The PAULSTRA mount selection guide shows a STABIFLEX mount with a deflection of 5 mm for a load of 210 daN. According to the STABIFLEX mounting data sheet, the mount required is a STABIFLEX 530622 hardness 45 with a square base.

- **Suspension characteristics (under 1 200 daN at 1 500 tr/mn)**

- 6 STABIFLEX mounts reference 530622 hardness 45.
- Deflection 4.7 mm.
- Theoretical attenuation 85% (16 dB).

#### 4.4.3 - Suspension of a sieve

- **Characteristics of the equipment**

- Weight: 400 daN.
- Vibration frequency (horizontal): 1200 cycles/mn or 20 Hz.
- Known centre of gravity.
- 6 mounting points.

Load per mounting:  $400/6 = 66$  daN.

Deflection (see chart, shape 5).

For a frequency of 20 Hz, a deflection of **6 mm** will achieve an attenuation of approximately 70%.

Mount characteristics required:

- 1) mounts which will withstand the vertical load;
- 2) mounts with a radial flexibility very much greater than the axial flexibility (mounting with dominant radial flexibility);
- 3) providing vibration isolation vertically (axially), which, taking account of requirement (2), will assure the horizontal vibration isolation.

The PAULSTRA mount selection guide gives a RADIAFLEX cylindrical stud giving a deflection of 8 mm for a load of 70 dan.

According to the RADIAFLEX mounting data sheet, the mount required is a stud Ø 30 height 30 mm with 2 mounting bolts (ref. 521312).

The radial flexibility (shear) is considerably higher than axial flexibility (compression).

- **Suspension characteristics :**

- 6 RADIAFLEX cylindrical mounts with 2 screws reference 521312 (theoretical vibration attenuation : 80% - 14 dB).

#### 4.4.4 - Suspension of a compressor unit

##### • Characteristics of the assembly

- Weight: 6000 daN.
- Speed of rotation : 400 rpm.
- Known centre of gravity.
- 8 mounting points.
- Load per mount:  $6000/8 = 750$  daN.

##### • Deflection of the mountings

For a frequency of 400 rpm, the minimum deflection to be within the vibration isolation region is 12 mm. The PAULSTRA mounting selection guide gives a low frequency mounting which can provide sufficiently large deflections (26 mm).

According to the EVIDGOM mount series data sheet, the mounting required is an EVIDGOM mount Ø 125, height 140 mm, reference 810784 which gives a deflection of 26 mm under a load of 800 daN.

##### • Suspension characteristics

- 8 EVIDGOM mountings reference 810784, Ø 125 mm, height 140 mm.
- Deflection 26 mm.
- Attenuation 37% (4 dB).

**Note :** as the low frequency mounts are tall, for some applications (sideways forces) it may be necessary to provide lateral stops.

#### 4.4.5 - Suspension from a ceiling (false ceiling, ventilation units, pipework)

- For light loads of 15 to 135 kg per item our TRAXIFLEX mount may be used directly.

##### Example of use :

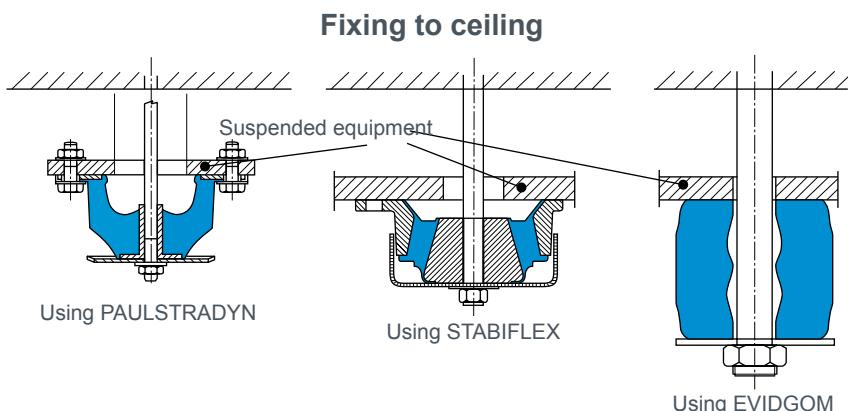

False ceiling - load per mount 50 kg - frequency of excitation 25 Hz - mounting selected 535611 hardness 45 - deflection under load 4 mm - theoretical vibration attenuation 77% - 13 dB.

- For heavy loads, it is necessary to use a PAULSTRADYN, STABIFLEX or EVIDGOM mounting with a safety fixing.

##### Example of use :

1. Suspending a ventilation unit - weight 1000 daN - frequency 25 Hz - 4 PAULSTRADYN mount Ø 100 reference 533712 - natural frequency. 7 Hz - theoretical vibration attenuation 90% - 20 dB.
2. Suspending a special 5 tonnes machine requiring accurate radial positioning - frequency 20 Hz - 4 STABIFLEX mount reference 530652 hardness 60 - deflection under load 8 mm - theoretical vibration attenuation 84% - 16 dB.
3. Suspending a 20 tonnes tank subject to longitudinal expansion - frequency 15 Hz - 4 EVIDGOM mount reference 810733 hardness 60 - deflection under load 50 mm - theoretical vibration attenuation 95% - 26 dB.

Presence of liquid : Yes  No

If Yes precise : .....

# RADIAFLEX®

## DESCRIPTION

- Metalwork : mild steel, plated.
- Natural rubber, bonded, cylindrically shaped.
- Fixing by screws, nuts or mixed.

European thread standards are not always consistent with French thread standards so Paulstra has created the Radiaflex® Europe range based on those standards.

The end stop version is now available with a threaded hole in addition to the threaded stud.

## CHARACTERISTICS

The design of the RADIAFLEX® mount gives the following basic characteristics:

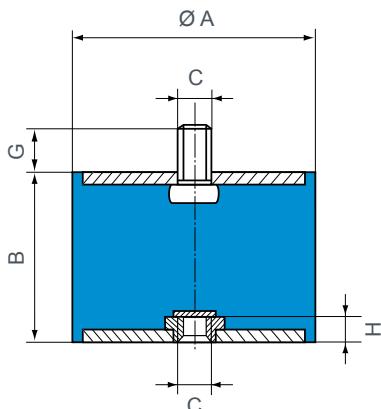

- radial elasticity greater than axial elasticity.
- the rubber works in :
  - compression (axial),
  - shear (radial),
  - compression/shear according to the fixing method.

### Advantages

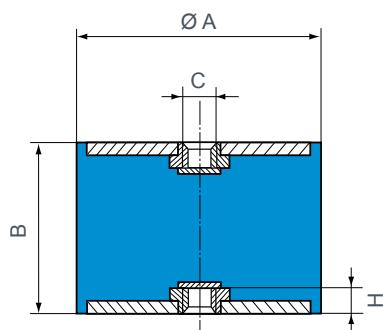

- Simple to fix.
- Simple and economical.
- Extensive range

## ASSEMBLY

The fixing holes for the Radiaflex mounts should have a chamfer with a depth equal to the pitch of the thread.

# STOPS

See :  
Supports and  
Bump stops

## DESCRIPTION

There are several types of stops :

- cylindrical or DIABOLO stops;
- conical progressive stops;
- LEVAFLEX progressive stops with central cavity;
- EVIDGOM stops.

## OPERATION

The design of the PAULSTRA elastic stops gives the following basic characteristics :

- highly deformable allowing high energies to be absorbed;
- progressive absorption of energy due to the carefully designed shape.

### Advantages

- By comparison with rigid stops, PAULSTRA elastic stops are quiet and avoid hammering and deterioration of equipment.

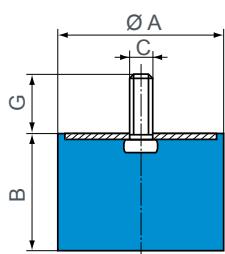

### Recommendations

- The stops must be fitted so that, on impact, the axis of the stop is perpendicular to the contact surface.
- On impact, the external diameter of the stop increases: this must be allowed for when fixing.

## DEFLECTION CURVES AND ENERGY VALUES FOR PROGRESSIVE, LEVAFLEX AND EVIDGOM STOPS

# PAULSTRADYN®

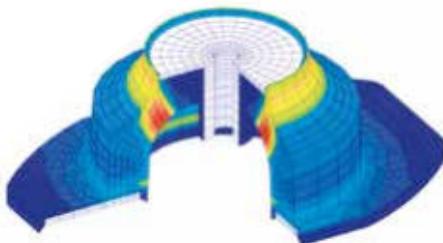

Natural frequency : (1)  
- axial : 7 Hz  
- radial : 3 to 5,5 Hz

## ADVANTAGES

- Better than 90% isolation at 1.500 rpm (25 Hz).
- Constant height over wide load range.
- Stabilised characteristics during Service Life.
- Simple to fit.
- 500 hours protection against salt spray\*.
- Design.

\*When mounted according to the recommendations given in the catalogue.

Finite element modeling (FEM) was used when designing the Paulstradyn® series resulting in the lowest possible elastomer stresses and most efficient performance for a high deflection mount of this type.

### Resilient Element = SILTECH

- Low increase of stiffness with frequency
- Low creep

## APPLICATIONS

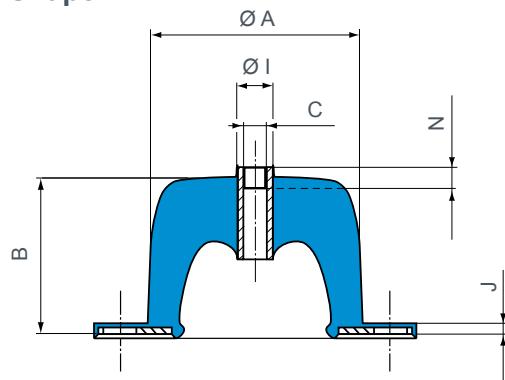

Antivibration isolation for static equipment :

- rotating machinery such as fans, air-conditioning, pumps, compressors, generator sets;
- pipeworks, ceilings, transformers, electrical enclosures.

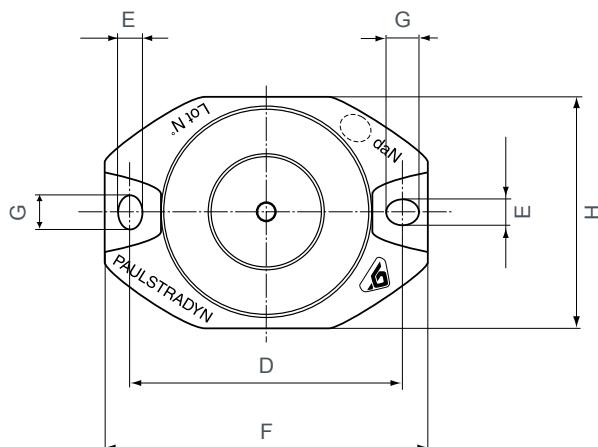

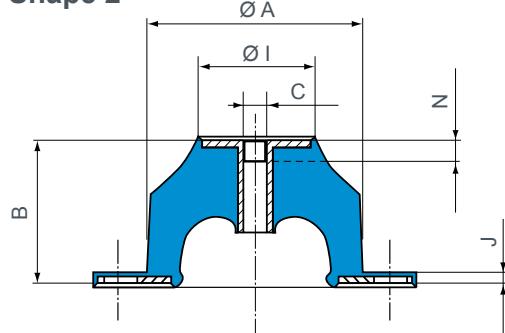

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

\* Height, unloaded 40 mm, under load 32 mm (see Technical Characteristics).

NL : Nominal static load with mounting under axial compression.

# TECHNICAL CHARACTERISTICS

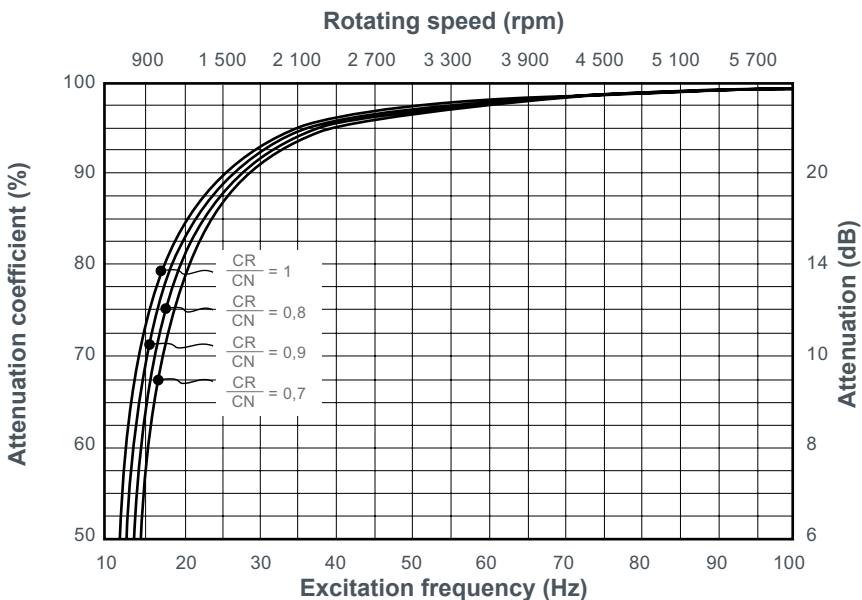

The vibration attenuation and height characteristics under nominal loads are **stabilised after one month under a load at 20°C**.

## General characteristics

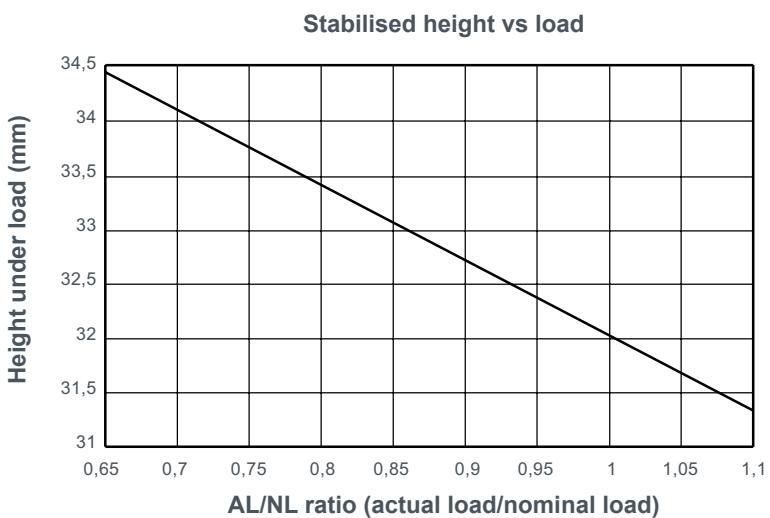

- Natural axial frequency : 7 Hz, with nominal load.
- Natural radial frequency : 3 to 5.5 Hz.
- Maximum displacement :
  - axial : 12 mm
  - radial :  $\pm 10$  mm.

## Vibration attenuation

$$\frac{AL}{NL} = \text{Ratio actual load} / \text{nominal load}$$

## Height under load

## Temperature

Operating temperature : - 20 °C to + 70 °C.

## Other characteristics\*

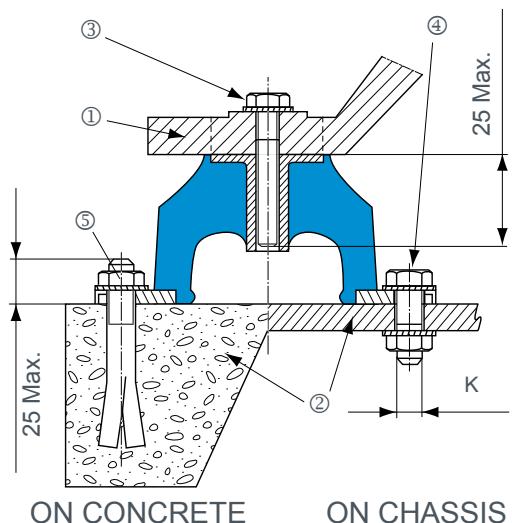

Good dynamic performance at high frequency  
Withstand fatigue and shocks.  
Reduced creep.

\* Detailed Technical Characteristics can be sent on request. Ask us for details.

# MOUNTING

# EVIDGOM®

Natural frequency :  
2,5 to 7 Hz (1)

## DESCRIPTION

The EVIDGOM® mount is formed from two thick conical membranes joined at their bases to create a highly elastic mounting.

There are two variations :

- all rubber EVIDGOM®;
- EVIDGOM® with bonded fixing;

## OPERATION

The design of the EVIDGOM® mount gives the following basic characteristics:

- a very high axial elasticity;
- very low natural frequency (a few Hertz);
- progressive buffer against shocks or accidental overload.

### Advantages

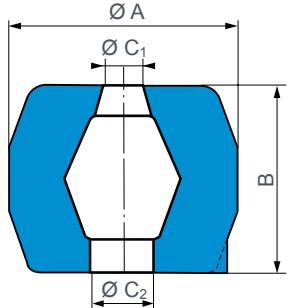

- As the load/deflection curve has a point of inflection, a suspension may be designed to have a sub-tangent greater than the static deflection.
- The elastomer used provides intrinsic damping with a corresponding ability to absorb energy which gives appreciable advantages over metallic springs.

### Recommendations

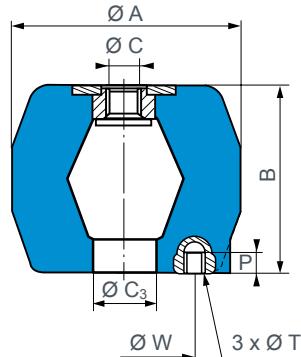

- The selection of a low natural frequency (large deflection) must not be allowed to endanger the stability of the suspension (tall equipment).
- In certain cases (use under maximum load) the use of side stops is recommended.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

# “SANDWICH” MOUNTS

Natural frequency :  
5 to 13 Hz (1)

## DESCRIPTION

The SANDWICH mount comprises one or more layers of elastomer bonded to flat, parallel metallic plates. These mountings may be cylindrical or rectangular. They are designed to withstand very high compressive loads. The range of mechanical characteristics is governed by the hardness of the rubber and the number of intermediate metallic plates.

These mountings can support compression from 20 to 100 bars.

The elastomer is polychloroprene which provides a high resistance to atmospheric exposure.

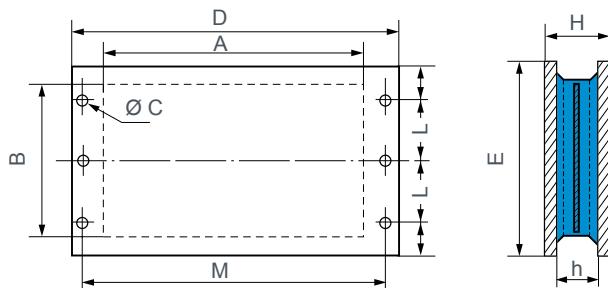

## OPERATION

The design of the SANDWICH mount gives the following basic characteristics :

- very slim;
- large surface area;
- stackable mountings;
- the suspended equipment is free to move in all directions;
- high ratio of compression stiffness to shear stiffness;
- very high compression loads.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# STABIFLEX

Natural frequency : (1)  
6 to 11 Hz

## DESCRIPTION

The STABIFLEX mount comprises a conical rubber section bonded between inner and outer metal parts.

- Steel Centre axis with threaded hole.
- Aluminium Square (four holes) or diamond base (two holes) with clearance hole.
- Bonded natural rubber, anti-slip bead.
- Cup to protect the rubber and distribute the load.

## OPERATION

The design of the STABIFLEX mount gives the following basic characteristics :

- axial elasticity two or three times higher than radial elasticity;
- the rubber works in shear/compression;
- progressive buffer against shocks or accidental overload;
- anti-slip (may be placed directly on the ground).

### Advantages

- The machine may be placed with its mounts directly on the ground.
- Speed of fixing.
- Easy movement of suspended machinery.
- Rubber protected against harmful liquids.
- Extensive range : 3 hardnesses of rubber for five existing types, allowing the mount to be optimised as a function of the load and exciting frequency.
- May be used with an anti-rebound washer.

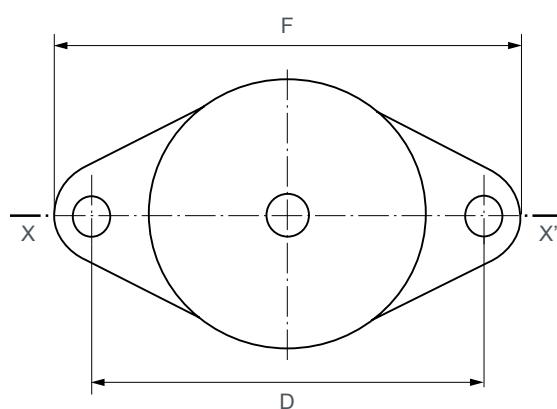

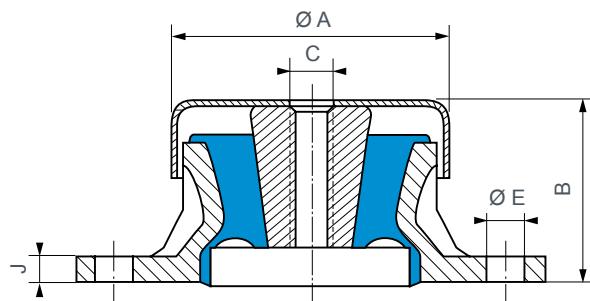

### Recommendations

- In order not to affect the performances of the mounting system, all external connections must be flexible.
- STABIFLEX mounts must be fitted so that the vibration input is in the axial direction.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

## ASSEMBLY

### Standard fixing methods

### Fixing with anti-rebound washer (not included)

- The anti-rebound washer (not supplied, plan on demand) is fixed to the lower side of the centre axis.
- In this case, do not forget to fit a spacer.

Spacer thickness required for reference :

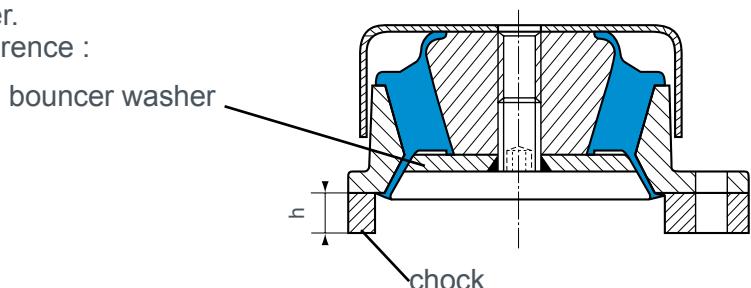

530603 h= 2 mm

530613 h= 4 mm

530622 h= 7 mm

530642 h= 14 mm

530652 h= 14 mm

# PAULSTRAFLOAT

Natural frequency : (1)  
- axial 8 Hz

## DESCRIPTION

Paulstrafloat mount of rectangular design is composed of :

- diamond base (2 holes) with clearance hole;
- cup to protect the rubber and distribute the load;
- progressive stiffness and rebound for protection against shocks.

## OPERATION

The design of the Paulstrafloat mount gives the following basic characteristics :

- differents stiffness in 3 axis : vertical - longitudinal (length) - width;
- the rubber works in shear/compression;
- set position control with the slots;
- higher axial stiffness;
- this mount is suitable for mobile equipment.

### Advantages

- The machine may be placed with its mounts directly on the ground.
- Quick installation.
- Rubber protected against harmful liquids.
- Extensive range : 3 hardnesses of rubber for 3 existing types, allowing the mount to be optimized as a function of the load and forcing frequency.
- Anti-rebound and fail-safe.

### Recommendations

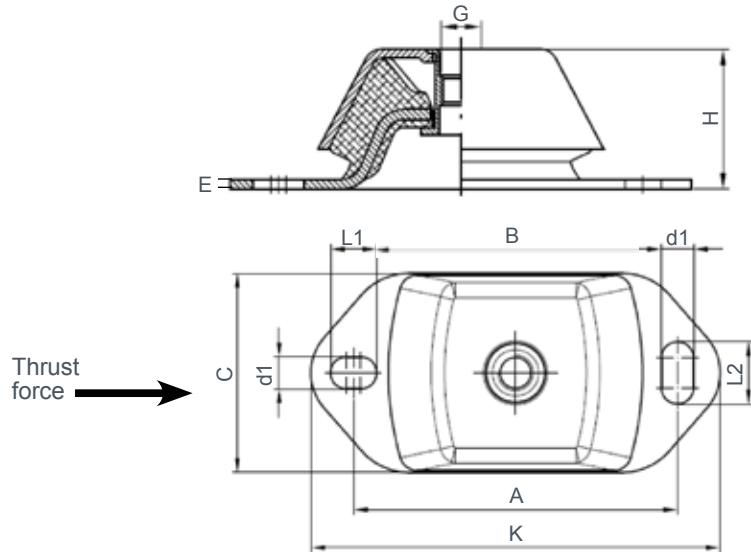

- Paulstrafloat mounts must be installed on the longitudinal axis to handle thrust force.

## APPLICATIONS

Paulstrafloat mount is perfectly suitable for shipboard equipment, motor suspension, transports and boarding equipment. Used for static applications : generator, pump, fan ...

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# S.C. MOUNTS

Natural frequency :  
6 to 30 Hz (1)

## DESCRIPTION

The S.C. mount comprises an annular section bonded between the inner tube and outer housing. The outer housing has a mounting flange (four different types).

## OPERATION

The design of the S.C. mount gives the following basic characteristics :

- axial elasticity four times higher than radial elasticity;
- the rubber works in shear;
- progressive buffer against shocks or accidental overload, provided that a large metal washer is used to bear against the rubber dome;
- can be used as a fail safe assembly when fitted as in shape 1.

### Advantages

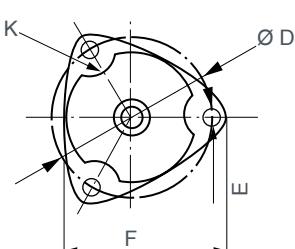

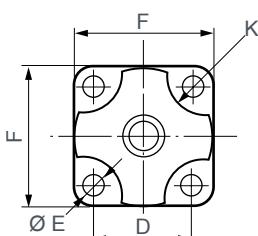

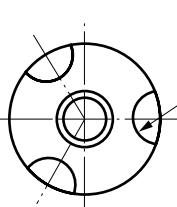

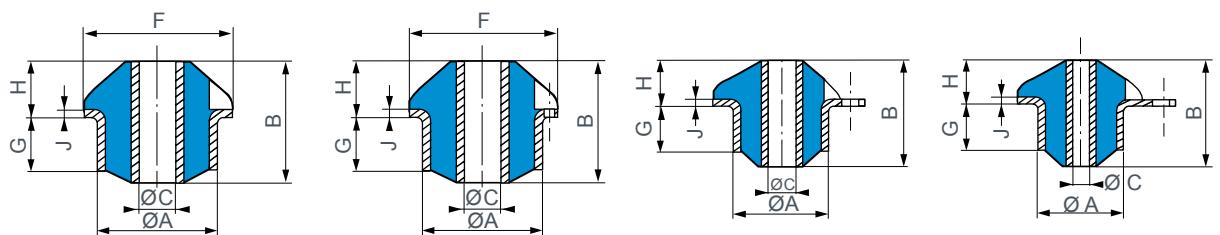

- Extensive range: three hardnesses of rubber for 20 existing types, allowing the mounting to be optimised as a function of the load and exciting frequency.

### Recommendations

- In order not to affect the performance of the mounting system, all external connections must be flexible.
- S.C. mounts must be fitted so that the vibration input is in the axial direction.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

## LOAD/DEFLECTION CURVES IN AXIAL COMPRESSION

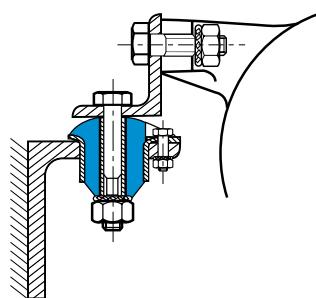

## ASSEMBLY

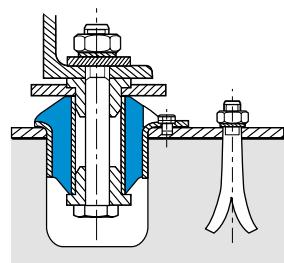

### Exemples of installations

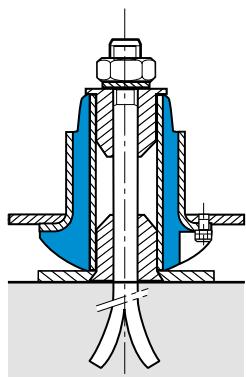

Shape 1 - Fixing between the equipment and a metallic chassis (failsafe in mobile applications).

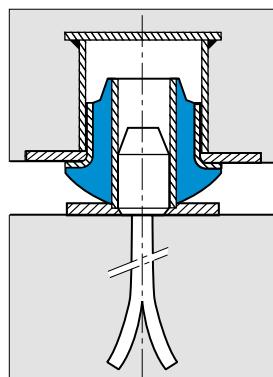

Shape 2 - Fixing between two brackets onto a vertical surface (non failsafe).

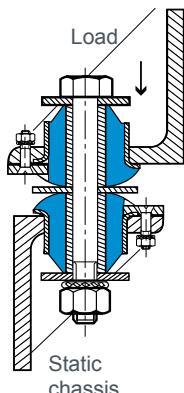

Shape 3 - Fixing between the equipment and concrete (using locating rings).

Shape 4

Shape 5

Shape 6 - Two mounts fixed face to face. Provides twice the deflection under the same load.

# S.T.C.

Natural frequency : (1)  
10 to 25 Hz

## DESCRIPTION

The S.T.C. mount comprises a rubber ring bonded to a central tube.

- Inner tube : mild steel.
- Bonded rubber in the form of a ring at the top with a collar below which is used for fixing.

## OPERATION

The design of the S.T.C. mount gives the following basic characteristics :

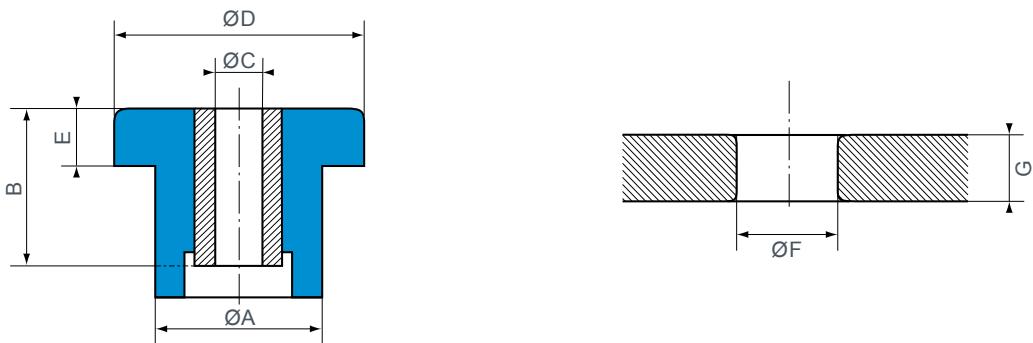

- the rubber works in compression;
- anti-rebound;
- can be used as safety mounting.

### Advantages

- Simple to fix.
- Simple and economical.
- Extensive range of loads.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# MOUNT 22000

Natural frequency : (1)  
10 to 15 Hz

## DESCRIPTION

The 22000 mount is made of two parts of elastomer bonded to a central tube.

- Interior reinforced : cylindrical tube.
- Elastomer : chloroprene. Range of five different stiffnesses.

## OPERATION

The design of the 22000 mount gives the following basic characteristics :

- elastomer element resistant to oils, supporting axial and radial loadings;
- axial to radial stiffness of 1:1;
- absorb vibration and reduce noise in all directions.

### Advantages

- Good isolation against structural noises.
- Chloroprene resistant to oils.
- Simple and economical.
- Simple to fix.
- Five sizes for a load capacity under axial pressure from 18 to 954 daN and under radial pressure until 443 daN
- Anti-rebound effect when it is assembled with a washer.

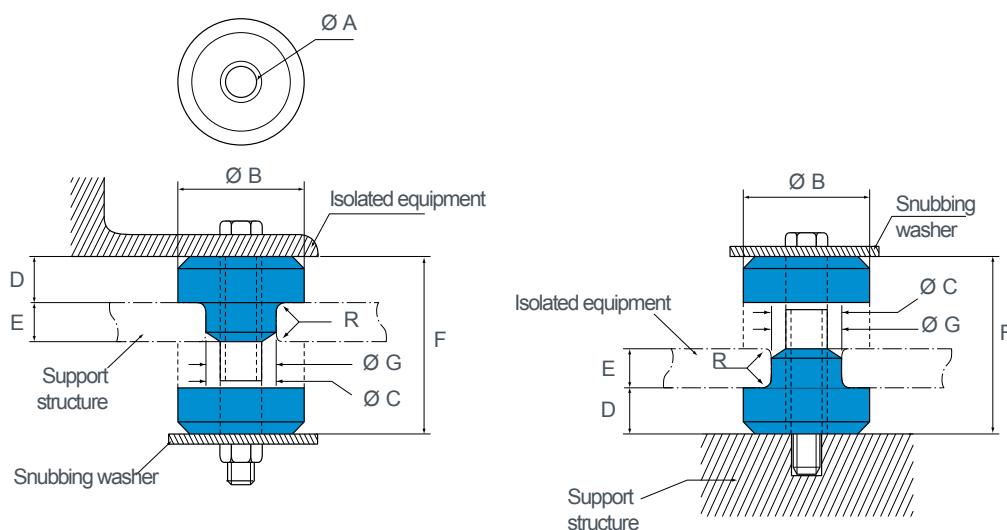

## APPLICATION

22000 mounts can be used in static or mobile applications, such as : pumps, compressors, generators, electronic equipment, HVAC equipment, engines with internal combustion, transmissions, plant cabs, radiators, etc.

1) the indicated natural frequency, are valid for the max loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

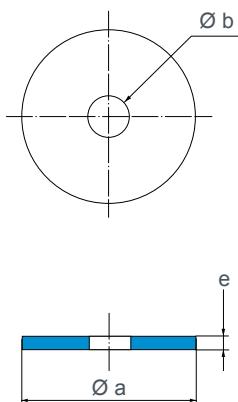

# DIMENSIONS CHARACTERISTICS

G : Ø mounting hole  
 C : Ø elastomer  
 F : Free height  
 R : Radius required

E : support structure thickness can be  $E_1$  or  $E_2$  depending on the required load and natural frequency (see technical chart next page).

# FLEX-LOC

## DESCRIPTION

A flexible fixing resistant to oils, the majority of solvents and ageing.

## OPERATION

The design of the FLEX-LOC mount gives the following basic characteristics :

- the rubber works in :
  - compression (axial);
  - shear (radial);
  - compression/shear according to the fixing method.

### Advantages

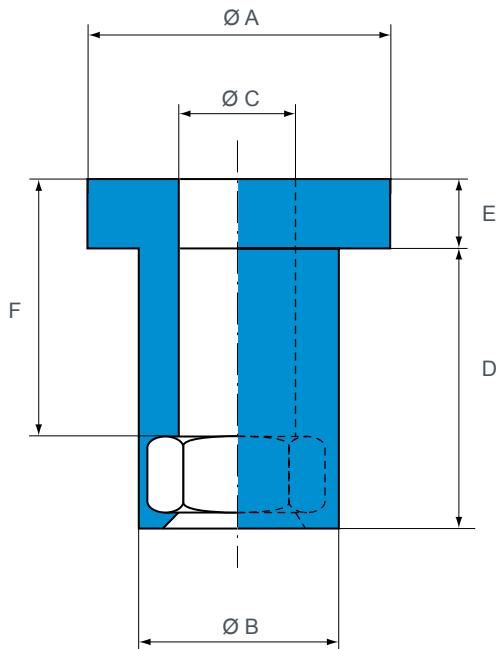

- 80% reduction at 150 Hz of vibrational energy transmitted from normal structural frequencies.
- Simple and economical.
- Simple to fix.
- Light weight.

## APPLICATIONS

FLEX-LOC are suitable for the fixing of sheets, frameworks, engines, ventilators, electronic equipment, computers, etc.

They have, moreover, a function of insulation against the structure borne noises, unlike other fasteners.

# TRIAXDYN

Natural frequency : (1)  
10 Hz

## DESCRIPTION

This anti-vibration mount Triaxdyn comprises two elastomers which are assembled into a casting and pre-loaded.

The mounting is designed to offer :

- a large deflection (in axial);
- different stiffness in three axis;
- built-in stops to limit movement in all directions.

**Note :** the mount body can be modified to offer alternative interface dimensions providing the internal interface with the elastomer is maintained.

## APPLICATIONS

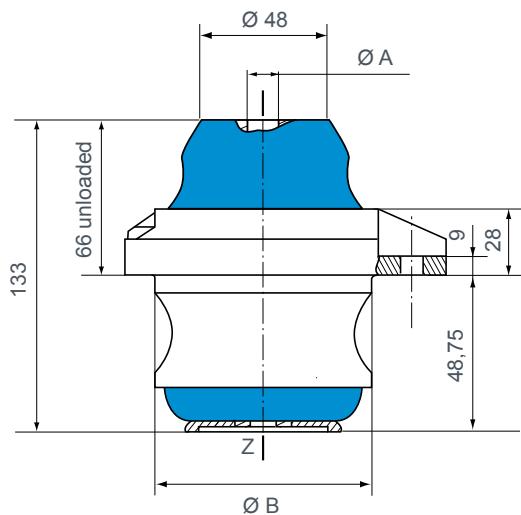

This mount has been designed to isolate engines or cabs in fixed or mobile applications with a high level of isolation and shock protection. Its compact design enables fail safe suspension of loads from 150 to 280 kg.

It is suitable for :

- engine mounting;
- cab mounting;
- equipment mounting.

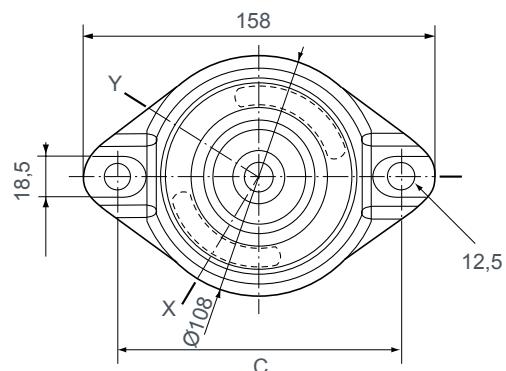

# DIMENSIONS CHARACTERISTICS

- Nominal load : 150 to 280 kg.  
Possibility to extend, on request, the load range up to 350 kg.
- Different stiffness in three axis (for a hardness 50) :
  - axial on Z : 500 N/mm;
  - radial on X (in direction of voids) : 350 N/mm;
  - radial on Y (at 90 deg. to voids) : 500 N/mm.
 The geometry of the part provides low dynamic stiffness in the vertical dimension.
- Maximum deflection :
  - axial :  $\pm 10$  mm,  $\pm 4$  g;
  - radial :  $\pm 6$  mm,  $\pm 2.5$  g.
- Operating temperature :
  - 40 up to + 80°C.
- Salt spray protection 400 h. for external aluminium metalwork.

\* Note: custom made part, many variants available, contact us.

# ENGINE MOUNTING SYSTEMS

Natural frequency : (1)  
6 Hz

## DESCRIPTION

This ENGINE MOUNT is made of one conical elastomeric element enclosed in a cast iron assembly. A built-in adjustable stop limits the vertical and lateral displacement during shock. It can be supplied with or without levelling system and with a threaded hole or a threaded stud.

## OPERATION

This mount has been designed to suspend fixed or mobile generators which require a high level of vibration isolation and shock protection. The load per mount varies from 600 kg to 2300 kg. This load range is covered by 5 different variants (12 to 16) clearly identified by a coloured marking (see table).

This mount is available in two different alternatives depending on the type of upper fixing needed :

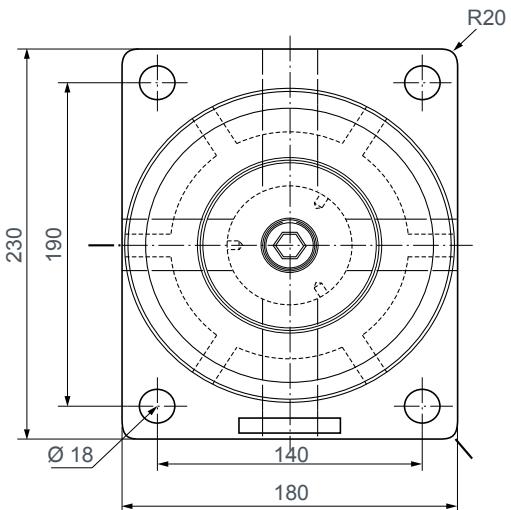

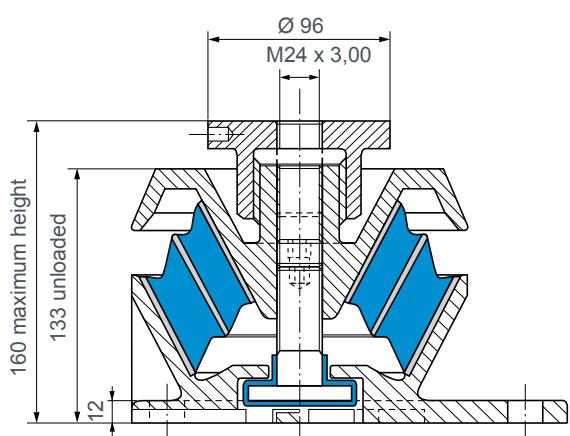

- 905201 : No levelling system - M24 x 3.00 threaded hole.
- 905202 : Built-in levelling system - M24 x 3.00 threaded hole.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# OPERATING CHARACTERISTICS AND DIMENSIONS

- Load range : please refer to the chart below for the different variants and their colour marking.
- Deflection under static load :  
4,5 to 7,5 mm (Natural frequency : 5 to 6,5 Hz.)
- Maximum displacement :  
vertical (Axial) :  $\pm 6$  mm;  
lateral (Radial) :  $\pm 4$  mm.
- Structural resistance :  
vertical (Axial) :  $\pm 4$  g;  
lateral (Radial) :  $\pm 2$  g.
- Operating temperatures : - 10°C up to + 70°C.
- Unit weight : 11.5 to 12.8 kg (depending on the variant).

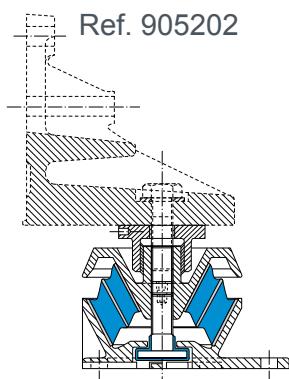

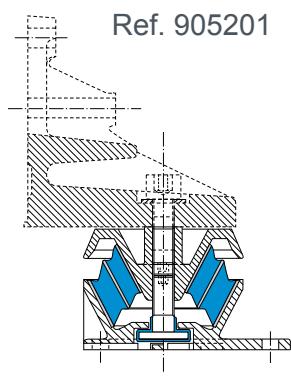

Load range (daN)	Variant	Color
600 - 850	12	White

- Progressive stiffness.

# NIVOFIX®

See Vibrachoc  
metallic range  
V43 - V44  
V45 - V46

## DESCRIPTION

The NIVOFIX® mount is an adjustable equipment foot comprising a circular disc bonded to a protected rubber base. An adjustment screw permits the levelling.

The rubber base has anti-slip ridges.

## OPERATION

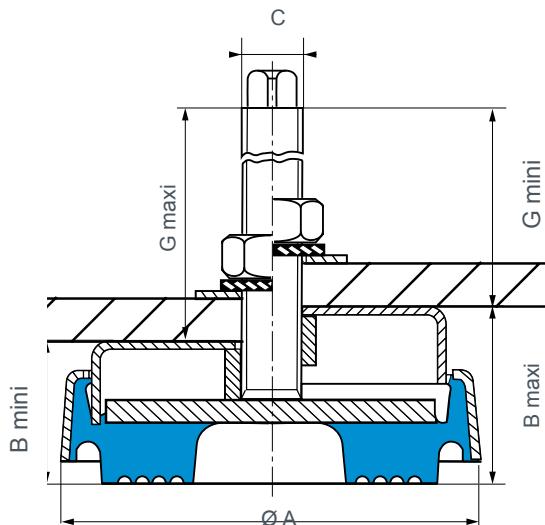

The design of the NIVOFIX® mount gives the following basic characteristics :

- accurate adjustment of the mount to correct the equipment's seating (adjustment screw, correction of altitude);
- absorbs high frequency vibrations;
- corrosion resistant (nitrile elastomer, protective shroud, galvanised metallic parts);
- anti-slip sole (no need to fix).

### Advantages

- Speed of fixing.
- Simple removal of the equipment.
- No shimming.

## APPLICATIONS

NIVOFIX® mounts are used for all equipment requiring height adjustment.

Equipment already using NIVOFIX® mounts :

- Vertical mill
- Mortiser
- Multichuck drill
- Sheet metal bender
- Polisher
- Press
- Plane
- Horizontal mill
- Lathe
- Gear cutter
- Textile machinery
- Packaging machine
- Test equipment
- Printing press

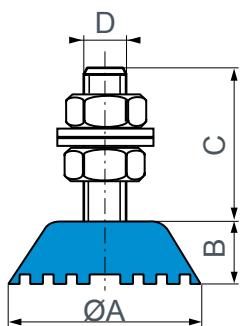

## DESCRIPTION

The MINIFIX® mount comprises an elastomer pad with an anti-slip ridged surface and a threaded stud allowing accurate height adjustment of equipment.

Made in two hardnesses (50 and 80 Sh) the MINIFIX® mount is perfectly suited to a variety of applications and is delivered complete with fixing nuts and washers. MINIFIX® mounting nuts and screws are made of steel or stainless steel.

\* Threaded centre hole.

## APPLICATIONS

Simple and economic, MINIFIX® mountings are particularly suitable for the installation of equipment such as :

- electrical or electronic enclosures.
- equipment for the food industry.
- packaging equipment.
- laboratory equipment.
- test and measuring equipment.
- household appliances.

# BECA

Natural frequency : (1)  
8 to 14 Hz

## DESCRIPTION

The BECA mount comprises one piece elastomer bonded to a top and bottom plate.

- Top plate : smooth or threaded (welded nut) hole.
- Bottom plate : fixing lugs or direct bearing on the ground.
- Bonded rubber.
- Domed rubber ring.
- Anti-slip bead or grooved anti-slip sole.
- Removable protective top cover : protects the rubber and distributes the load.

## OPERATION

The design of the BECA mount gives the following basic characteristics :

- transverse elasticity approximately the same as the axial elasticity (equifrequency);
- rubber works in compression;
- progressive buffer against shocks or accidental overload;
- anti-slip (may be placed directly on the ground).

### Advantages

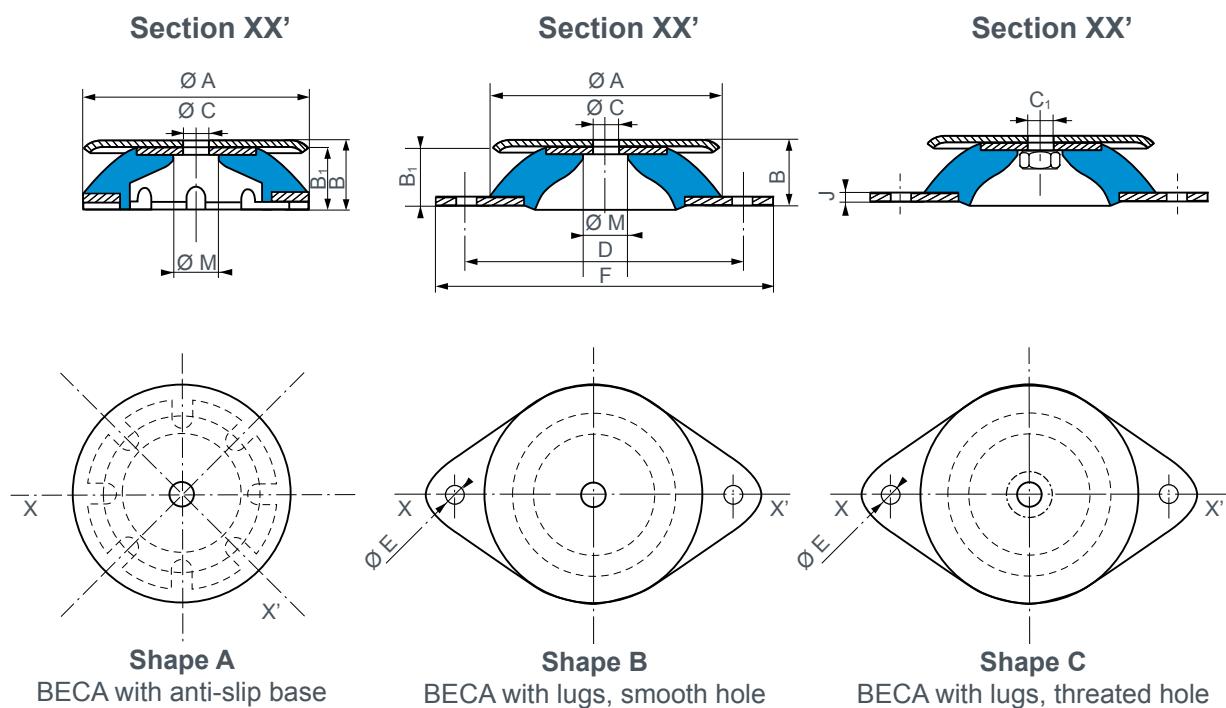

- The machine may be placed (with its mounts) directly on the ground.
- Very slim.
- Speed of fixing.
- Simple removal of the assembly.
- Extensive range : 3 hardnesses of rubber for 6 existing sizes, allowing the mounting to be optimised as a function of the load and stimulation frequency.
- A choice of 3 fixing styles.

### Recommendations

- In order not to affect the suspension of the machine, all external connections must be flexible.
- BECA mount can be used for fixed, well-balanced rotating machinery, otherwise a ballasting slab should be used.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# TRAXIFLEX®

Natural frequency : (1)  
8 à 10 Hz

See Vibrachoc  
metallic range :  
VE101 - VE111  
VE112 - VE113

## DESCRIPTION

The TRAXIFLEX® hanger comprises two metallic U armatures joined by two bonded rubber blocks. It is available in two versions : male/female and female/female.

## OPERATION

The design of the TRAXIFLEX® hanger gives the following basic characteristics :

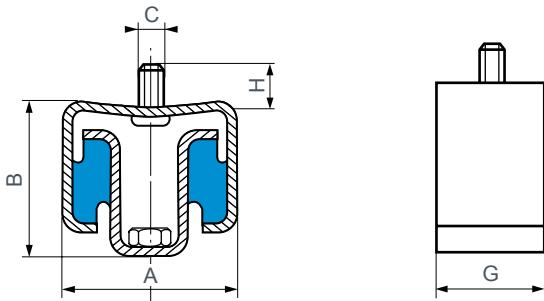

- rubber works in compression-shear;
- the same deflection under nominal load for all types;
- safety system in case of elastomer failure.

### Advantages

- Economic solution for suppressing structure borne noise.
- Several fixing methods.
- High resistance to atmospheric exposure :
  - galvanised armatures;
  - chloroprene elastomer.
- Upper metallic part is shaped to simplify orientation while fixing.
- Two hardnesses of elastomer to extend the choice of mounting as a function of load.
- Filtration of vibration and the attenuation of the consequent noise.
- Allows movement due to thermal expansion.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

TRAXIFLEX® mounts have been subjected to acoustic trials at the Centre Expérimental de Recherches et d'Études du Bâtiment et des Travaux Publics which has given the P.V nr. 554.6.078.

\* Elastomer resistant to fire M1.

# ASSEMBLY

When fixing, ensure that all the TRAXIFLEX® hanger are supporting the same load. It is necessary to ensure that they are all the same distance from the fixing surface (ceiling, girder, plank...). TRAXIFLEX® mounts can be used to suspend pipework : the whole assembly being fixed to the ceiling.

- suspending hot air ducts;
- suspending a fan unit and distribution ducts;
- suspending a hot air generator with continuous airflow;
- suspending an integral cased air conditioner.

# ISOFLEx®

Natural frequency :  
11 to 15 Hz (1)

## DESCRIPTION

The ISOFLEx® mount comprises two concentric metallic parts joined by a bonded, perforated rubber ring.

## OPERATION

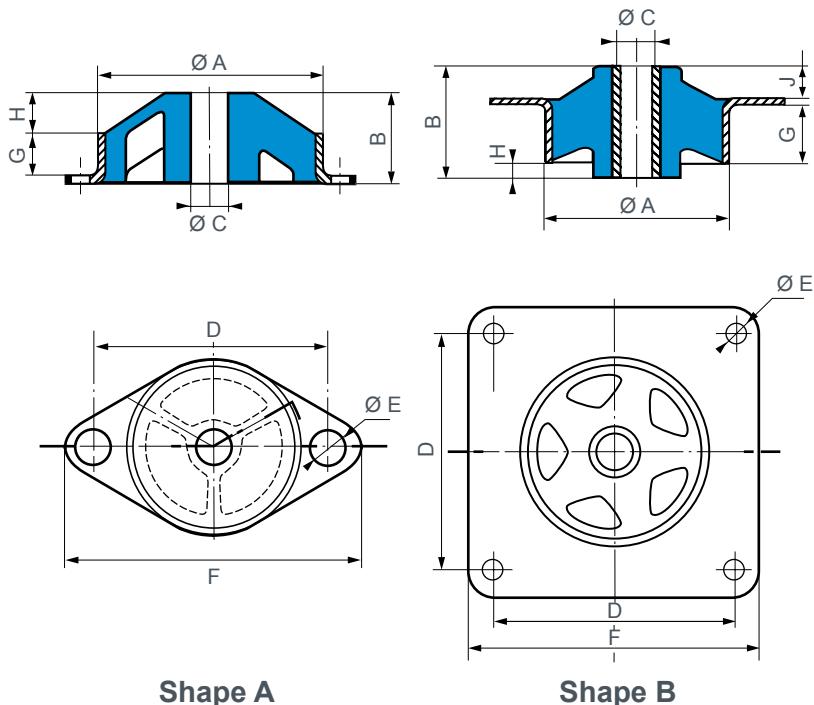

The design of the ISOFLEx® mount gives the following basic characteristics : elasticity approximately the same in all directions (equi-frequent mounting).

## APPLICATIONS

ISOFLEx® mounts may be used for suspending any small measuring or recording equipment, mobile equipment, machine tool controls.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# ASSEMBLY

Fixing method

To avoid toppling or canting, the suspension should be designed so that the centre of gravity of the suspended equipment is close to the geometrical centre of the suspension.

# ISODYNE®

## DESCRIPTION

The ISODYNE® mount comprises two half mountings joined together.

## OPERATION

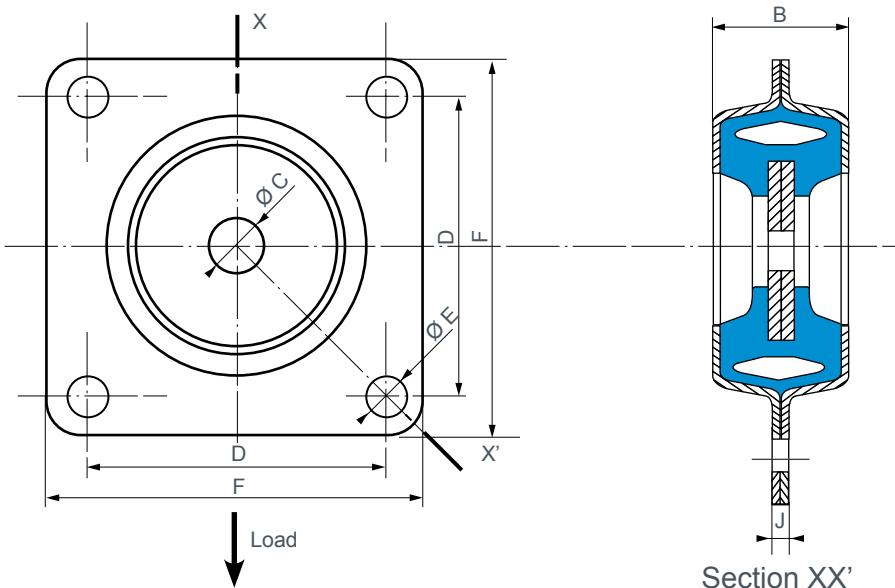

The design of the ISODYNE® mount gives the following basic characteristics :

- a very high axial to radial stiffness ratio;
- vertical fixing avoiding excessive inclination of the equipment;
- fixing at any angle;
- safe (551571), anti-rebound.

## APPLICATIONS

ISODYNE® can be used to suspend lightweight equipment in a vertical plane.

# RINGS AND BUSHINGS

Natural frequency : (1)  
6 to 28 Hz

## DESCRIPTION

These all elastomer parts are compatible with the majority of the industrial environments and have an operating temperature range of - 40°C to + 83°C.

## OPERATION

A ring assembled with the associated bushing constitutes a flexible interface and a simple solution to decrease noise and vibrations.

- These supports can be installed in parallel for a greater load capacity and may also be stacked in series when greater deflection capacity is required.
- Bushings can be used in pairs, bushing end to bushing end, without rings for a more robust installation or where the structure thickness does not allow for a standard ring and bushing assembly.

### Advantages

- Highly efficient noise reduction,
- Absorb shock and vibrations,
- Simple and economic,
- Four models in four stiffnesses for load capacities going from 0.5 to 160 kg per isolator.

## APPLICATIONS

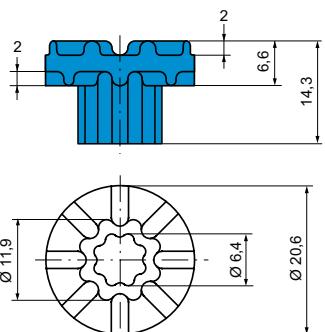

- Office machines, motors, fans, HVAC equipment, electronics equipment, telecommunication equipment; etc.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# ELASTOMER MOULDED PARTS

SILICONE RUBBER / SPECIAL ELECTRONICS /  
LOW LOADS

## CHARACTERISTICS

These parts are usually supplied in VHDS (very high density silicone) rubber and the full reference should include:

- the letter S,
- the appropriate grade which corresponds :
  - to the youngs modulus of the rubber under static compression in accordance with ASTM D945 (ref. 33 to 77),
  - or to the stiffness measured on a part (ref. 16 to 25).

These standard VIBRACHOC grades are shown in the following table:EPDM, butyle, nitrile.

Hardness	Color	Characteristics		
		G : Shear modul. (MPa)	E : Elast. modul. (MPa)	Stiffness (1)(2) (N/mm) Tolerance : ± 10%
		Tolérance : ± 15 %		
16	yellow			19
20	dark blue			20
25	black			25
33	light blue	0,4	1,2	36
38	grey	0,47	1,4	40
42	brown	0,53	1,6	45
48	dark green	0,6	1,8	50
55	brick red	0,67	2,0	55
63	orange	0,8	2,4	65
72	light green	1	3,0	75
77	ultramarine blue	1,1	3,3	100

(1) measured on standardised Ø 19 - h 12.7 mm high part.

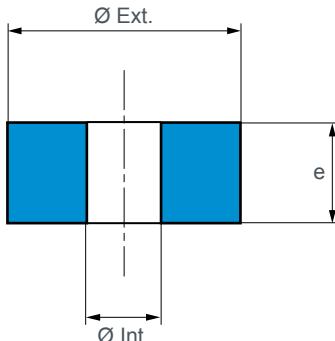

(2)For linear domain.

Example : E3RP0754S55 flat washer internal diameter 7, external diameter 30, height 6, in VHDS silicone, young modulus 2 MPa; washer colour: brick red.

Other elastomers may be used: natural rubber, neoprene, EPDM, butyl rubber, nitrile rubber.

# ELASTOMER PLATES E3PEPL

SILICONE RUBBER / SPECIAL ELECTRONICS / LOW LOADS

## DESCRIPTION

VHDS elastomer sheet.

## APPLICATIONS

These sheets may be used for making grommets, washers or anti-vibration mountings for equipment.

There is a wide range of VIBRACHOC moulded parts, but in certain cases, such as prototypes, undefined specification, etc, it is often advantageous to determine the suspension using elastomer components cut from sheet and bonded.

## CHARACTERISTICS

- Overall tolerances :
  - on the lengths :  $\pm 5\%$ ;
  - on the thickness :  $\pm 3\%$ .

Shape	Dimensions (mm)	Thickness (mm)
SQUARE	300 x 300	2, 3, 4, 5, 6, 8, 10

VIBRACHOC plates should be ordered using the following reference :

E3PEPL   
1    2    3

1 : dimension in cm - 2 : hardness (see p 114) - 3 : thickness in 1/10 mm.

For example : E3PEPL30S55C060 =

- square plate 300 X 300 mm;
- 6 mm thick;
- VHDS rubber compound, grade 55.

For other shapes, sizes or materials, ask us for details.

# DISC DRIVE SUSPENSION E4330F\*\*

SILICONE RUBBER / SPECIAL ELECTRONICS /  
LOW LOADS

Natural frequency : (1)  
20 to 30 Hz

## DESCRIPTION

A silicone (VHDS) elastomer with a bonded metal insert. The legs have tangs which enable each leg to be pulled through mounting holes in the equipment. The suspended component can then be attached with an M3 screw through the insert. The tangs can be cut off after insertion.

## APPLICATIONS

- Suspension of disc drives.
- Protection of electronic components and printed circuit boards with very low mass in mobile or static environments.

## CHARACTERISTICS

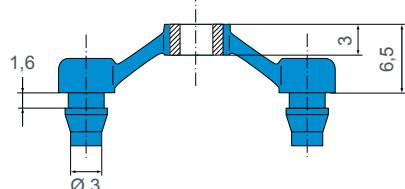

Natural Frequency :

- axial : 15 to 30 Hz;
- radial : 15 to 30 Hz.

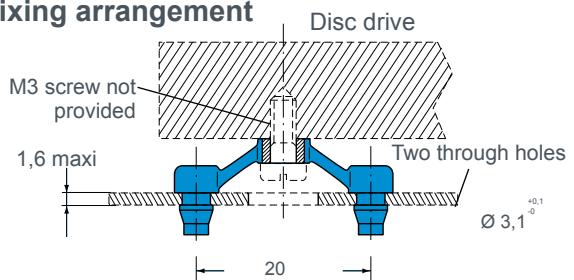

Amplification factor at resonance < 5.

Operating temperature range : -50°C to +150°C.

Reference	Nominal load (daN)
E4330F01	0,03
E4330F11	0,035
E4330F21	0,036
E4330F31	0,042
E4330F71	0,1

### Fixing arrangement

Possible installation configurations :

Mounting in compression

Mounting in shear

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# S.L.F.® MOUNTS

SILICONE RUBBER / SPECIAL ELECTRONICS /  
LOW LOADS

Natural frequency : (1)  
10 to 25 Hz

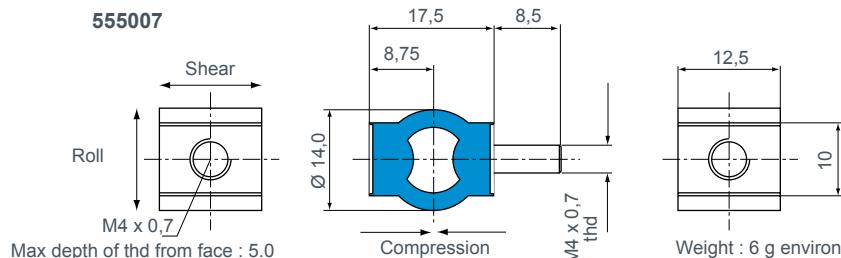

## DESCRIPTION

Low frequency high deflection antivibration mount available in rubber silicone. The zinc plated mild steel metalwork is fully bonded for improved fatigue strength.

## APPLICATIONS

These mounts have been designed to protect low mass components and instruments from vibration and shock and to isolate small rotating machines e.g. pumps and electric motors.

## DIMENSIONS

## OPERATING CHARACTERISTICS

Maximum sinusoidal input at resonance :  $\pm 0.5$  mm.

Resonance frequencies at maximum input : 10 to 25 Hz dependent on axis and load.

Axial to radial stiffness :

3 : 1.

Amplification at resonance :

silicone : 4 / natural rubber : 10.

Maximum displacement during shock :

axial : 5 mm.

radial : 7 mm.

Mechanical strength corresponding to a continuous acceleration of 10 g at maximum load.

Reference	Mix	Static load in compression (daN)	Static load in shear (daN)	Static load in roll en roulis (daN)	Temperature for continuous operation

NB : The \* define the type of fixing : combination fixing : 555007, male/male fixing : 555005, female/female fixing : 555006.

## ASSEMBLY

Improved stability can be achieved if the mounts are inclined at 45° towards the centre of gravity.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

# E1E931S

# E1E4045

SILICONE RUBBER / SPECIAL ELECTRONICS /  
LOW LOADS

Natural frequency : (1)  
15 to 25 Hz

## DESCRIPTION

- High damped silicon elastomer (VHDS).
- Stainless Steel flange and centre axis.

## APPLICATIONS

- Protection of electronic equipment, navigation equipment, control consoles, measuring instruments, onboard aircraft, trains and trucks.

## CHARACTERISTICS

Natural frequency :

- axial : 15 to 25 Hz;
- radial : 10 to 20 Hz.

Maximum sinusoidal input amplitude at resonance frequency :  $\pm 0,4$  mm.

Amplification factor at resonance < 4.

Operating temperature range : - 54 °C to + 150 °C.

Mechanical strength corresponding to a continuous acceleration of 10 g at maximum load.

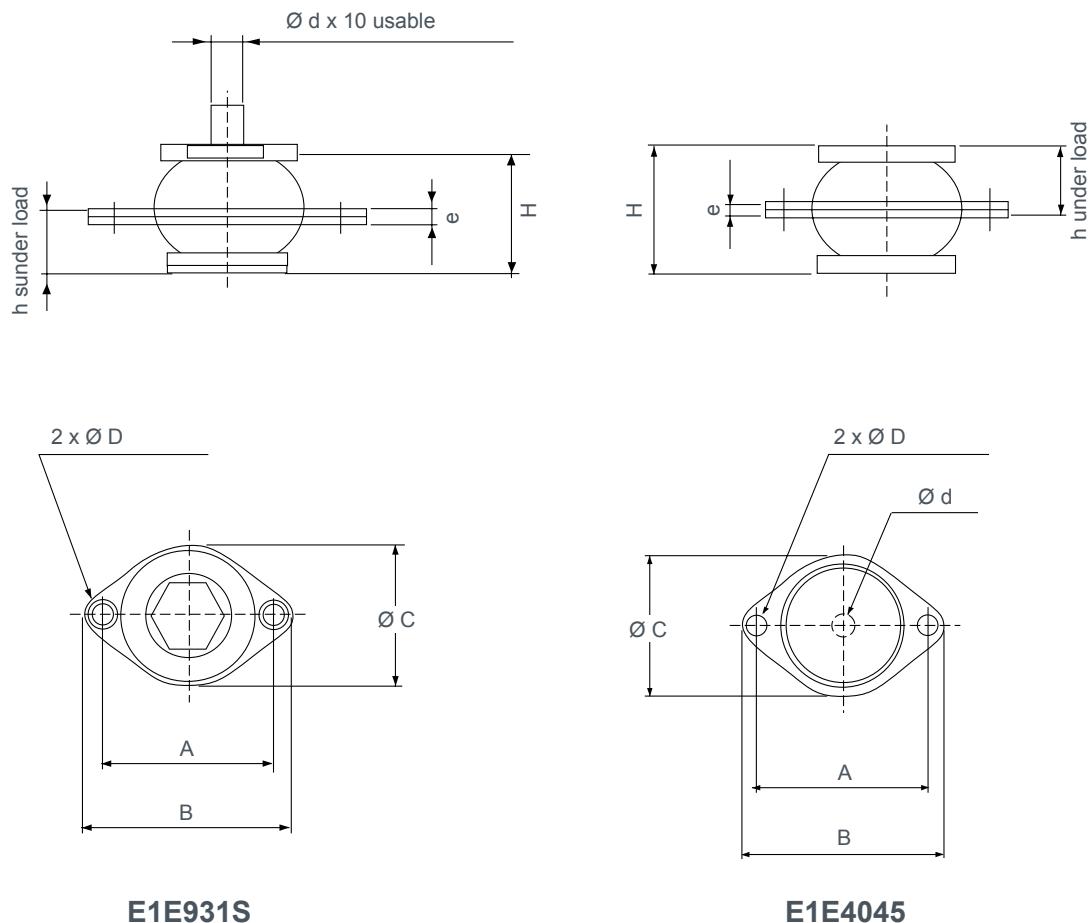

Maximum axial displacement during shock : 3 mm

Weight : E1E931S : 31 g.

SILICONE RUBBER / SPECIAL ELECTRONICS /  
LOW LOADS

Natural frequency : (1)  
20 to 25 Hz

## DESCRIPTION

- VHDS elastomer able to carry loads under compression and traction.
- Pedestal, washer and shaft in 18/8 stainless steel.

## APPLICATIONS

- Protecting electronic equipment, navigation equipment, instrument panels, measuring instruments, control panels on aircraft, road vehicles and railway trains.

## CHARACTERISTICS

Natural frequency :

- axial : 20 to 25 Hz;
- radial : 20 to 25 Hz.

Maximum permitted excitation at natural frequency of suspension :  $\pm 0.5$  mm.

Amplification factor at resonance < 5.

Operating temperature : - 54°C to + 150°C.

Structural strength corresponds to a continuous acceleration of 10 g at maximum load.

Maximum axial travel available for shock :

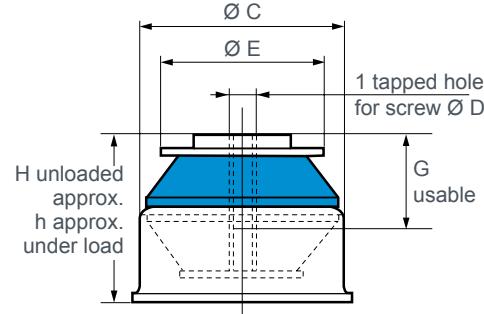

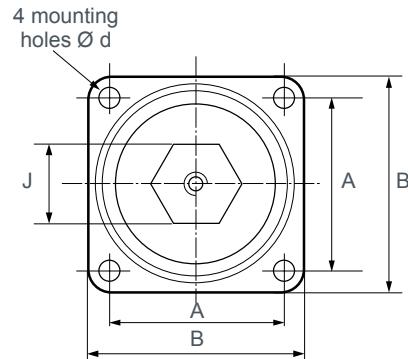

E1E11 : + 4mm / E1E12 : + 5 mm / E1E13 : + 7 mm.

Weight : E1E1 : 60 g / E1E12 : 120 g / E1E13 : 225 g.

These mounts meet the standard AIR7304 curve ZF

SILICONE RUBBER / SPECIAL ELECTRONICS

Natural frequency : (1)  
10 to 25 Hz

## DESCRIPTION

- VHDS elastomer able to carry loads under compression.
- Base and centre axis in 18/8 stainless steel.

## APPLICATIONS

- Protecting electronic equipment, navigation equipment, instrument panels, measuring instruments, control panels on aircraft, road vehicles and railway trains.

## CHARACTERISTICS

Natural frequency :

- axial and radial : 10 to 25 Hz.

Maximum permitted excitation at natural frequency of suspension :  $\pm 0.5$  mm.

Amplification factor at resonance < 4.

Operating temperature : - 54°C to + 150°C.

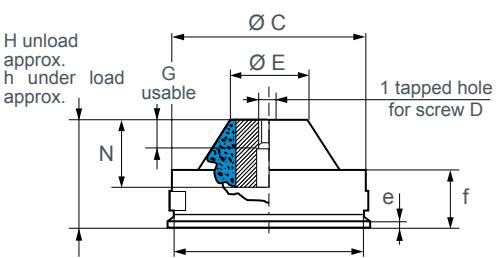

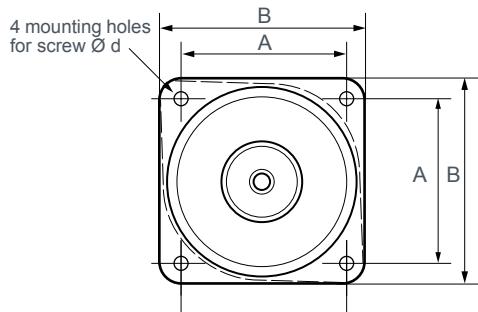

Structural strength corresponds to a continuous acceleration of 10 g at maximum load.

Maximum axial travel available for shocks :

E1E41: 8.8 mm / E1E42, E1E43 : 12 mm.

Weight : E1E41 : 22 g / E1E42 : 60 g / E1E43 : 96 g.

These mounts meet the standard AIR7304 curve ZF.

# E1E941S

Natural frequency : (1)  
15 to 30 Hz

## DESCRIPTION

- High damped silicon elastomer (VHDS).
- Stainless Steel flange and centre axis.

## APPLICATIONS

- Protection of electronic equipment, navigation equipment, control consoles, measuring instruments, onboard aircraft, trains and trucks.

## CHARACTERISTICS

Natural frequency :

- axial and radial : 12 to 30 Hz.

Maximum sinusoidal input amplitude at resonance frequency :  $\pm 0,5$  mm.

Amplification factor at resonance < 5.

Operating temperature range : - 54 °C to + 150 °C.

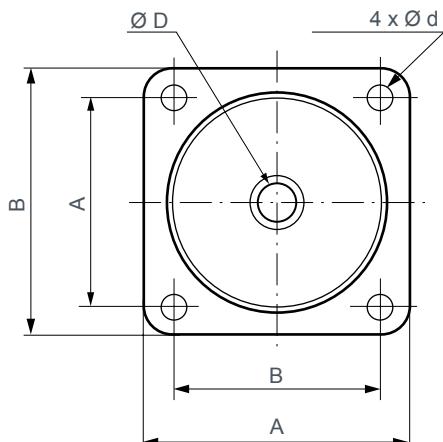

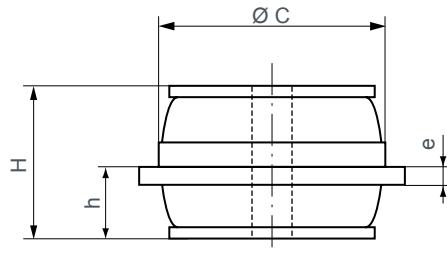

Mechanical strength corresponding to a continuous acceleration of 10 g at maximum load.

Maximum axial displacement during shock:

E1E941S : 4 mm.

Weight : E1E941S : 80 g.

These mounts meet the standard AIR7304 curve ZF.

# ARDAMP®

Natural frequency : (1)  
10 to 25 Hz

## DESCRIPTION

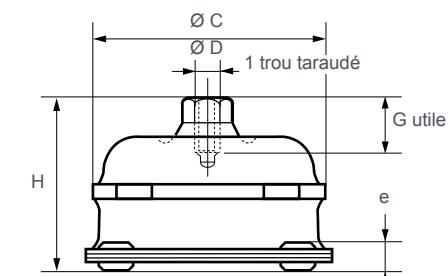

The ARDAMP® series dampers have a spring and piston embedded in high viscosity silicone rubber gel which itself is embedded in an elastomer membrane bonded to the case.

## APPLICATIONS

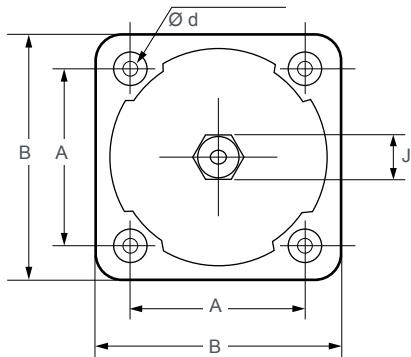

Due to their high performances and high shock damping capacity ARDAMP® dampers are designed to protect fragile electronic equipment, control panels and measuring instruments on ground vehicles, aircrafts, helicopters, civil and military submersible crafts.

## SPECIAL PACKAGING

Natural frequency : (1)  
10 to 25 Hz

## DESCRIPTION

The special packing dampers have a flexible elastomer element designed for various applications, bonded to two steel mounting plates.

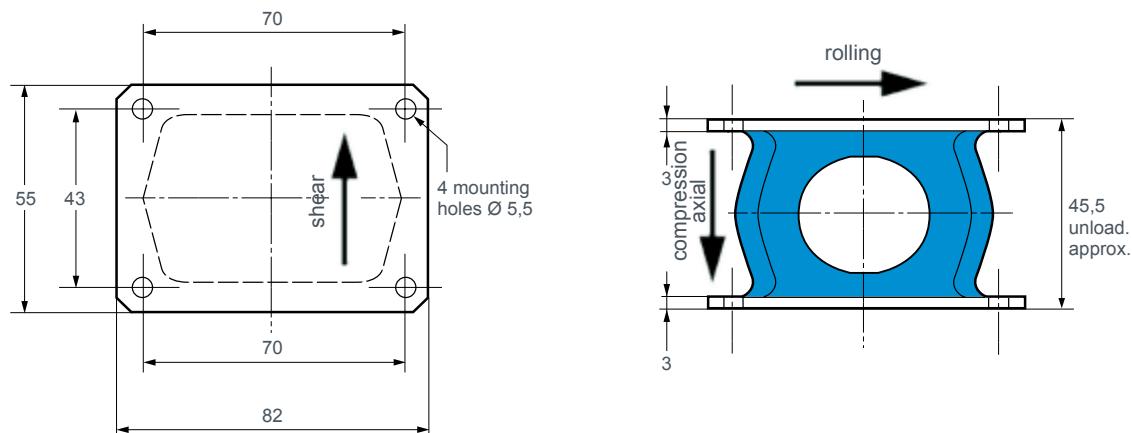

## APPLICATIONS

These multi-directional dampers allow considerable deflection to protect equipment transported in containers against drops and transport shocks (missiles, aeronautical equipment).

These dampers are also suitable for suspending equipment to be protected against shocks and vibrations caused by explosions or earthquakes.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

## DIMENSIONS

## OPERATING CHARACTERISTICS

Natural frequency :

- axial : 10 to 25 Hz;
- radial : 10 to 25 Hz.

Maximum permitted excitation at natural frequency of suspension :  $\pm 1.6$  mm.

Maximum travel available for shocks : - axial : 15 mm;

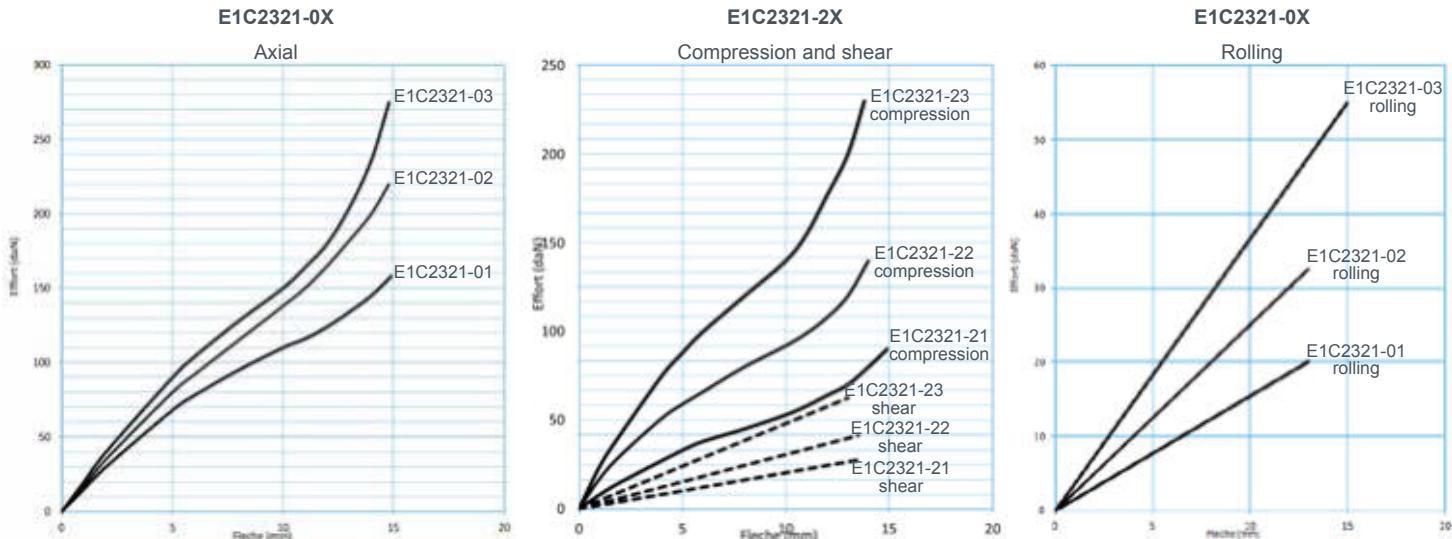

- radial : 40 mm.

Operating temperature : see table.

# SUSPENSION OF EQUIPMENT IN MOBILE APPLICATIONS

Natural frequency : (1)  
16 to 22 Hz

## DESCRIPTION

This mount has rubber moulded around a metal centre axis.

The elastomer is shaped so that the mount can be pressed into the mounting structure.

## OPERATION

The mount combines the advantages of low natural frequency and easy installation.

The simple design means the part can be assembled using a single bolt or screw fixing.

## APPLICATIONS

- Anti-vibration mounts suitable for mobile equipment mounted in light and heavy vehicles, construction equipment (hydraulic pumps, acoustic panels, control boxes, air conditioning sets, compressors,...).
- Isolation of light weight equipment in static environments.

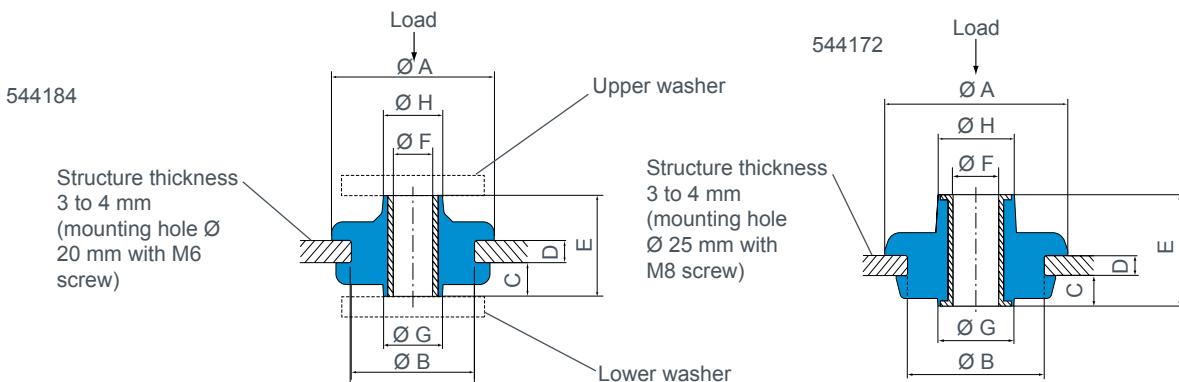

## CHARACTERISTICS

Natural frequency :

Axial and radial : 16 to 22 Hz.

Fail safe assembly possible with washers fitted above and below the mount.

# BATRA® RING

Natural frequency : (1)  
7 to 22 Hz

## DESCRIPTION

The BATRA® ring comprises a rubber ring bonded to two metallic washers one with a circular groove, the other with a mating circular ridge which allows BATRA® rings to be mounted one on top of another.

## OPERATION

The design of the BATRA® ring gives the following basic characteristics :

- behaviour identical to that of a metallic spring plus damper;
- robustness :
  - well behaved under shock;
  - removal of the risks of suspension collapse;
- flexibility easily tailored by stacking BATRA® rings;
- transverse creep limited by the two bonded armatures.

## APPLICATIONS

BATRA® rings may be used :

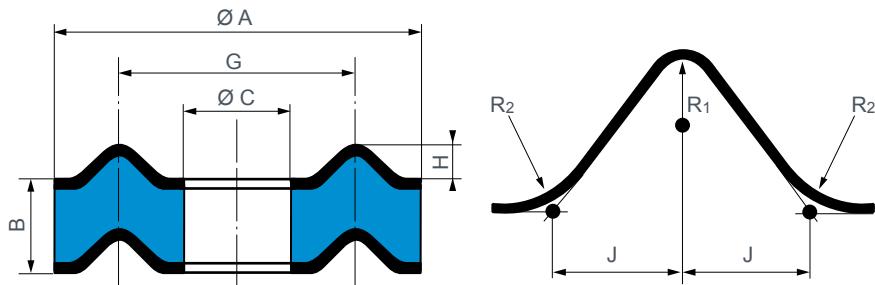

- for making suspensions that are very flexible vertically and also damped by the natural properties of the rubber (road and rail vehicles);
- for making very effective anti-shock buffers (wagons, cars, gantries).

For special applications, where the quantities would justify custom manufacture, it is possible to supply Special BATRA® rings either with only one bonded lower armature or "all rubber".

For special cases of shock, there are Special BATRA® rings with overlapping, non-bonded, armatures.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

(1) The instantaneous deflection indicated in this table is approximate as it depends on the impact speed.  
It is possible to use a metallic cushion for this application.

# ASSEMBLY

The rings are centred using the grooves and ridges. To avoid play under no-load conditions, the stack should be pre-compressed by 3 to 10% of its height. It is also necessary to leave sufficient room around the stack for the sideways expansion under load.

## NAVY SHOCK MOUNTING SYSTEMS

 HUTCHINSON®  
PAULSTRA

# NAVY SHOCK MOUNTING SYSTEMS

## INTRODUCTION

A shock mounting system must fulfil the following functions :

- supporting the suspended mass when there is no shock while providing isolation from vibration and structure borne noise;
- in case of shock: limit the force and/or movement to acceptable values;
- after shock : return the suspended mass to its initial position.

Schematically, there are two types of shock :

- an energy shock resulting from a falling mass for which the parameters taken into consideration are the incident kinetic energy and that restituted, the impact speed and the maximum forces and deflections.
- a shock resulting from a movement of the suspended mass. The parameters taken into consideration are the speed or acceleration of the assembly in time and also the forces relating to the maximum deflection.

## STANDARDS APPLICABLE TO THE MARINE MOUNTS

Reference*	Applications
BR 3021	Shock for onboard equipment
BR 8470	
BV 043	Shock for surface ships and submarines
DIN 95365	Marine mounts geometry and characteristics
GAM-EG-13C	Vibration and shock onboard ship
MIL-S-901D	Shock for onboard equipment
MIL-STD-167	Marine equipment vibrations
STANAG 4142	Shock resistance analysis of equipment for surface ships
STANAG 4549	Testing of surface ship equipment on shock testing machines
STI-MM-305	Vibration and shock testing for onboard equipment

\* For compliance with these standards according to the applications, ask our Technical Department.

## ADVANTAGES

- The mountings described below are intrinsically stable under shock, that is to say, they enable the mass to return to its initial position; the system retains no plastic deformation nor residual buckling when the shock stresses are removed.
- The suspended mass may therefore undergo successive shocks with impunity. Nevertheless, the stability of the assembly in relation to the relative positions of the mountings and the centre of gravity of the suspended mass should be checked.
- PAULSTRA shock mounting systems are also exceptionally effective against vibration.

# VIB LD 03

## DECOUPLING WASHERS

### DESCRIPTION

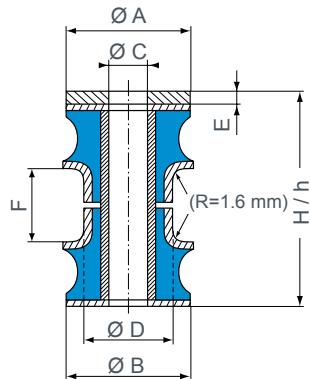

Elastomer rings for linking and positioning of equipment while maintaining acoustic discretion and protection from shocks.

A decoupling washer is composed of :

- Two bonded elastomer washers;
- One stainless steel anti-shock washer;
- One stainless steel preload spacer.

### CHARACTERISTICS

- Natural frequencies (vertical and axial) 15 to 20 Hz depending on load.
- Maximum deflection under shock:
  - axial : 8 mm;
  - radial : 5 mm.
- Mechanical strength corresponding to 30 times the nominal load.

# LOW DEFLECTION MOUNTS LOW LOADS

## DESCRIPTION

The main role of these mounts is to isolate vibration. A snubber system limits the movement of the suspended mass (10 mm), however the loads developed in this case, are high.

A wide load range from 0,5 to 32 daN depending upon the application.

In case of shock protection, the structural resistance of the mount can accept acceleration of up to 150 g. These mounts are mainly suited for vibration, hence the loads generated in case of shock are very high.

Fixation on the inside or on the outside.

## CHARACTERISTICS

- Natural frequencies (vertical and lateral) under a nominal load of 5 to 8 Hz.
- B = unloaded.
- B - 6 mm height under nominal load (deformation under load . 6 mm).
- Maximum deflection from loaded position  $\pm 10$  mm in all directions (vertical and lateral).
- Stop at 10 mm deflection, maximum acceptable loads =  $150 \times$  nominal static load.

# VIBMAR

Natural frequency :  
5 to 12 Hz (1)

## DESCRIPTION

The VIBMAR series has a base plate with two or four mounting holes and a tapped steel core. The elastomer is bonded to the steel.

E1N104 and E1N106 versions have a conical spring embedded in the rubber.

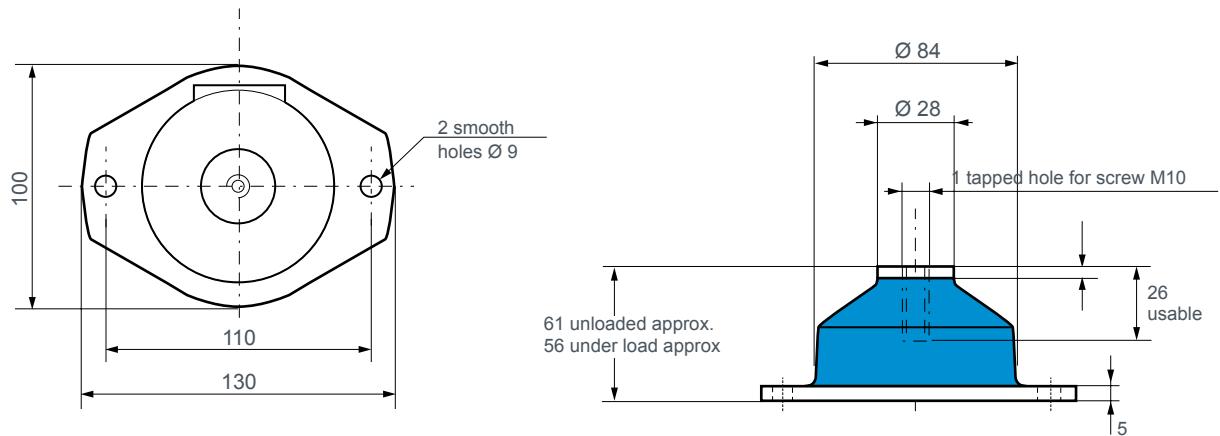

Environmental protection is provided by painting the metal parts and by coating the elastomer with an ozone resistant compound.

## APPLICATIONS

These multi-axis low frequency dampers have been specially designed to protect electrical or electronic racks and marine or road transport generator sets (on board or not). They are cone-shaped to absorb considerable displacement and shocks.

1) the indicated natural frequency, are valid for the maxi loads of the ranges of use quoted in the paragraph : TECHNICAL CHARACTERISTICS.

## DIMENSIONS

## OPERATING CHARACTERISTICS

Natural frequency :

- axial : 8 to 12 Hz;
- radial : 6 to 10 Hz.

Maximum permitted excitation at the natural frequency of suspension :  $\pm 1.25$  mm.

Maximum axial travel available for shocks : 30 mm.

Amplification factor at resonance : < 6 and < 4 for silicone rubber versions.

Structural strength corresponding to a continuous acceleration of 3 g with maximum load.

When suspending an enclosure, the same type of damper should be used as a stabiliser.

Operating temperature : - 30°C to + 100°C;

- 54°C to + 150°C for silicone rubber versions.

Weight : 0.6 kg.

## MEDIUM DEFLECTION MOUNTS

### LOW LOADS

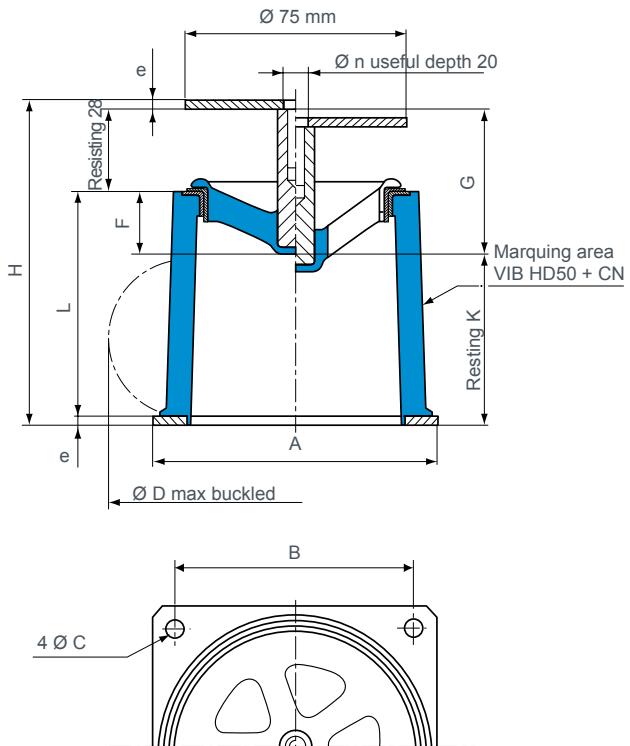

## DESCRIPTION

The permitted deflection (40 to 50 mm) of the suspended mass in relation to the mounting base limits reaction under shock. No efficient vibration protection is offered during shock.

## CHARACTERISTICS

- Natural frequency (vertical and lateral) under load of 5 to 8 Hz.
- Maximum deflection under load :
  - vertical :  $\pm 50$  mm\*;
  - lateral :  $\pm 45$  mm\*.
- H in rest position.
- H - 6 mm under nominal load  
(deflection under load = 6 mm).

\* maximum forces corresponding to 10 times the load.

## HIGH DEFLECTION SHOCK MOUNTS

### DESCRIPTION

Range of omnidirectional high deflection shock mounts made with a square base plate and a threaded core on the upper side.  
The elastomer, in natural rubber, is developed especially for navy applications (other materials on demand).

### ADVANTAGES

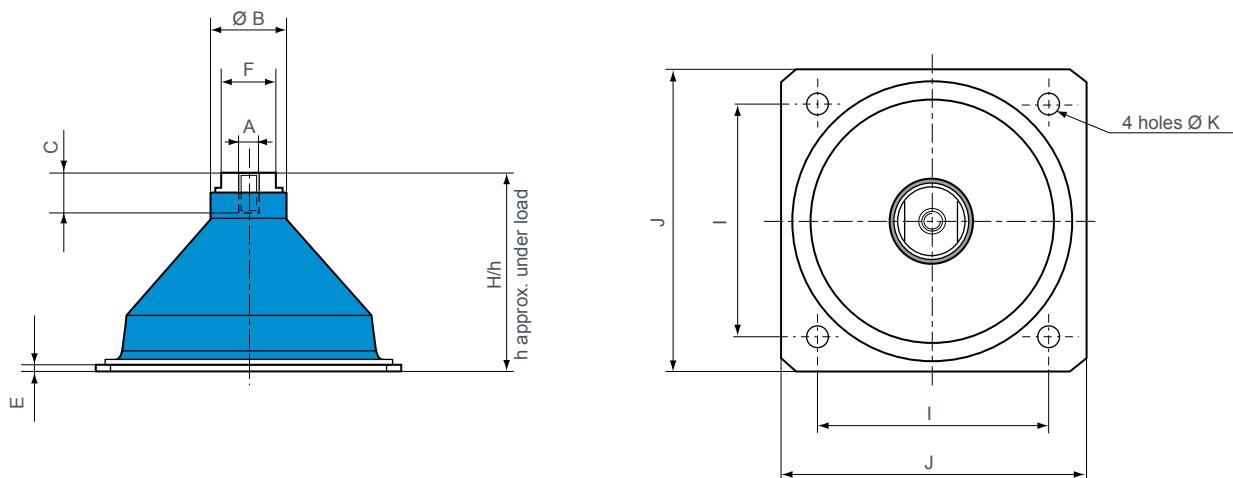

These mounts provide both high level of vibration isolation and shock protection. Its high structural strength corresponds to a continuous acceleration of 10 g under maximum load.

The range includes 17 different mounts covering a wide load range from 15 kg up to 1670 kg per mount.

This mount meets the latest US and European shock standards in use in the naval forces across the globe.

The metalworks are protected against corrosion (ie. : salt spray).

Installation without washer

Installation with washers

# ASSEMBLY

These parts are designed to be loaded in compression. They have to be installed on a flat surface covering the entire surface of the base plate. The supported structure is then secured to the central core using a high tensile screw M20.

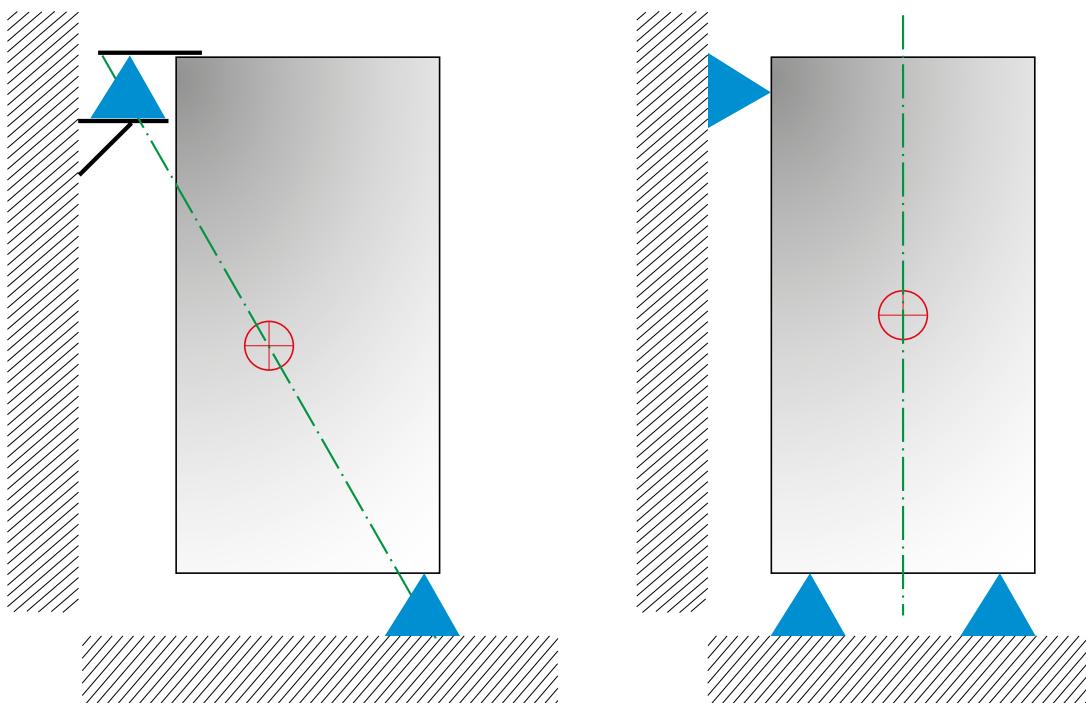

For a better result, the load per mount should be evenly distributed. In the case of a tall suspended equipment, these mounts can be used as stabilizing devices. They will be secured to the equipment only after stabilization of the base mount.

These mounts are not designed to carry a permanent load in shear or in tension.

All connections with the suspended equipment must be flexible and capable to accept high displacement allowing the suspensions to work properly.

We strongly recommend to have your installation approved by our technical department before ordering the mounts.

## Assembly drawings

# VIB HD 56

## MEDIUM DEFLECTION MOUNTS

HIGH LOADS

## DESCRIPTION

A complete range of high deflection omnidirectional mounts. They are made of two cast iron inserts, a threaded steel plate holding the fixing interfaces is added to one end. The elastomer is a specially developed natural rubber to meet the navy requirements (Other materials can be delivered on request).

## ADVANTAGES

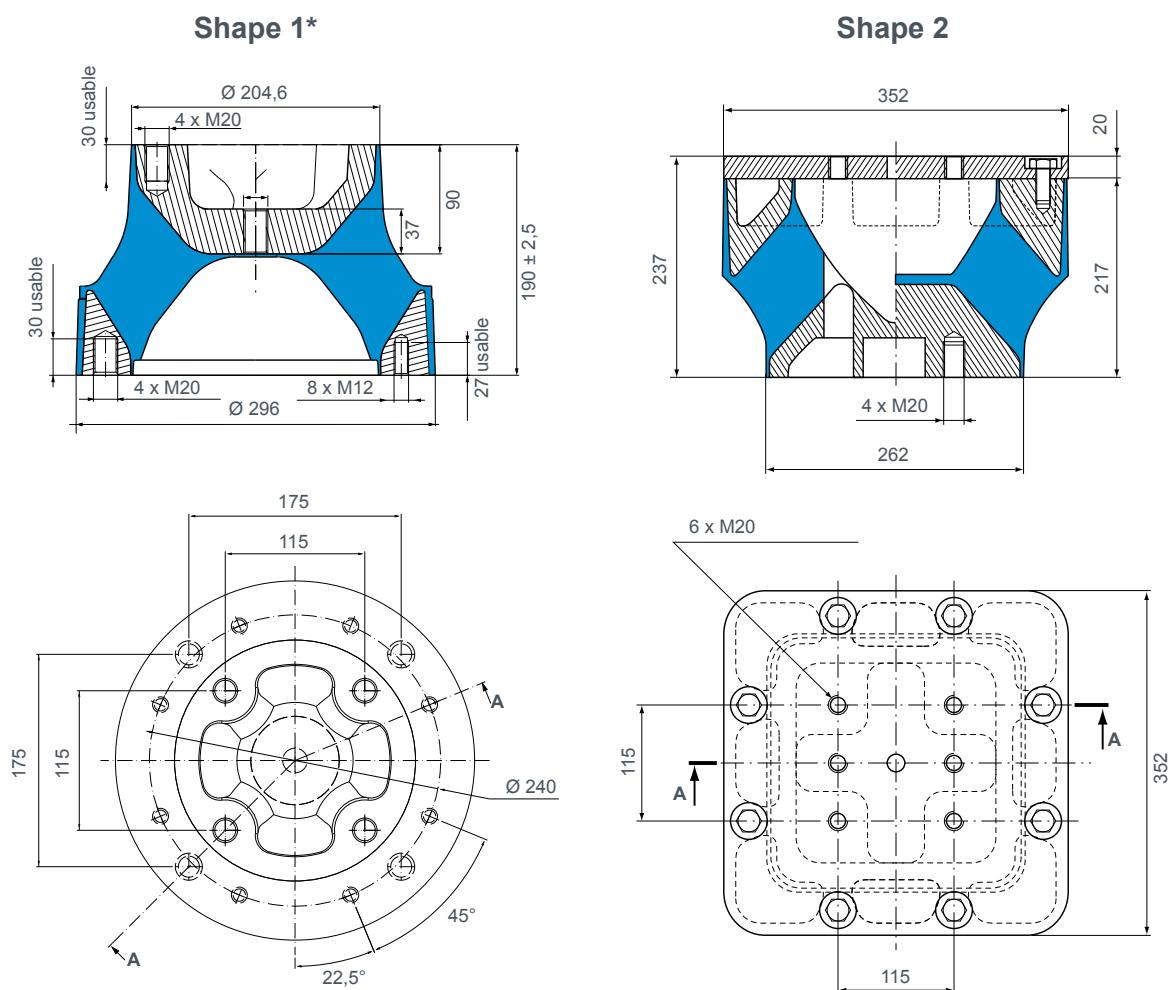

These mounts will provide both a very high level of vibration attenuation and a high shock capacity to reduce the transmitted acceleration. Its structural resistance correspond to a continuous acceleration of 10 g at the maximum load.

The range is made of several references with a load range ranging from 1125 daN up to 7000 daN per mount.

These mounts meet both the European and North American shock standards.

The metalwork are treated against corrosion.

## DIMENSIONS IN mm (for Shapes 1 & 2)

## OPERATING CHARACTERISTICS (for Shapes 1 & 2)

Load range (daN)	Reference	Shape	Height under max. load (mm)
850 to 1955 1050 to 2415 1250 to 2875 1600 to 3680	E1N-4001-54 E1N-4001-52 E1N-4001-53 E1N-4001-51	1	177 ± 2
3000 to 5000 4200 to 7000	E1N-4066-52 E1N-4066-51	2	220 ± 2

- Static nominal load : 1125 to 7000 daN per mount.
- Axial and radial natural frequency : 4 to 7 Hz depending on load.
- Displacement under shock : 56 to 60 mm depending on the axis.  
For the E1N-4001mount, it can be increased to 63 mm using spacers.
- Structural strength : 10 g at maximum load.
- Temperature range : - 30°C up to + 80°C.

\* Geometry evolution. Please consult us.

# ASSEMBLY

These mounts are designed to carry load in compression and should be installed on a smooth surface. The equipment in Men second using 4 M20 bolts (shapes 1 and 2).

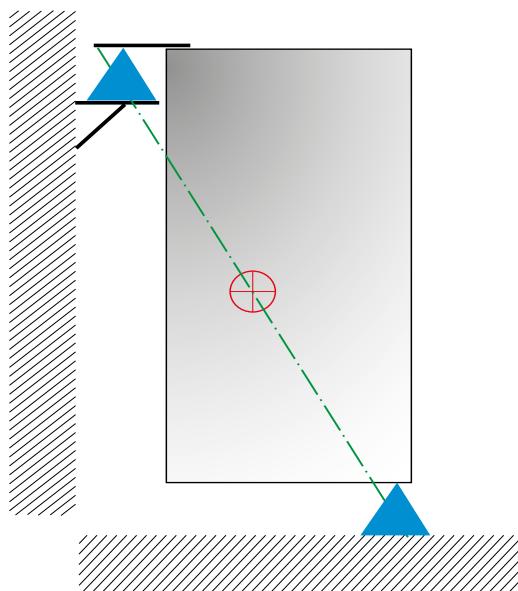

For a better result, the load per mount should be evenly distributed. In the case of a tall suspended equipment, these mounts can be used as stabilizing devices. They will be secured to the equipment only after stabilization of the base mount.

These mounts are not designed to carry a permanent load in shear or in tension.

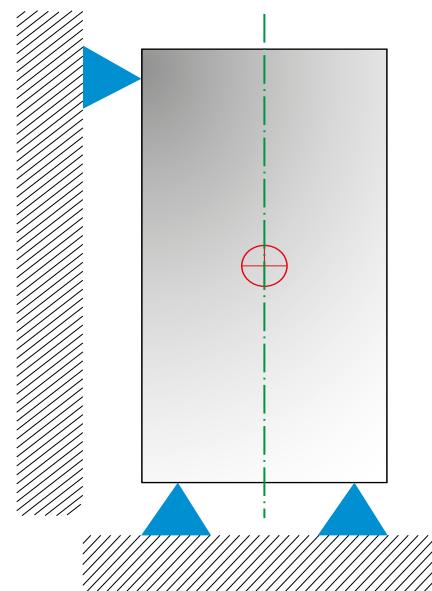

All connections with the suspended equipment must be flexible and capable to accept high displacement allowing the suspensions to work properly.

We strongly recommend to have your installation approved by our technical department before ordering the mounts.

# GB 530 MOUNTS

Natural frequency : (1)  
5 Hz

## DESCRIPTION

The GB530 comprises of one part in elastomer bonded to a base plate and a tapped steel core (a non magnetic version is also available).

### Advantages

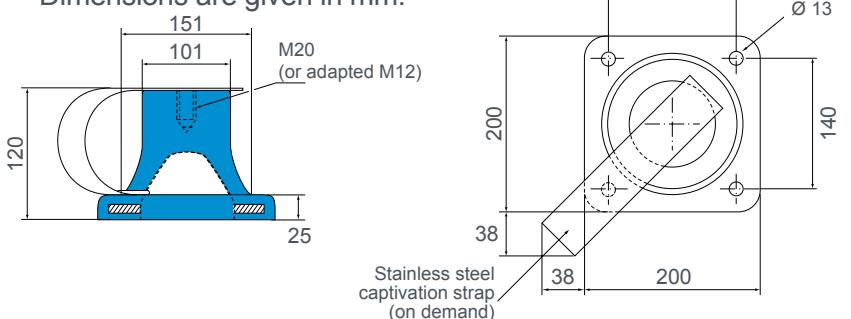

- Can provide high deflection under shocks.
- Long life.
- Low natural frequency (5 Hz in axial).
- Low amplification at resonance.(8 at 10)

## APPLICATIONS

These are specific mounts created for the naval industry : on board electronics, radars, special weapons equipment.

## DIMENSIONS

Dimensions are given in mm.

## VERY HIGH DEFLECTION

LOW LOADS

## DESCRIPTION

A range of multi directional mounts with very large deflection manufacture with elastomer and metal parts.

The elastomer is based on natural rubber which has been specially developed for marine applications.

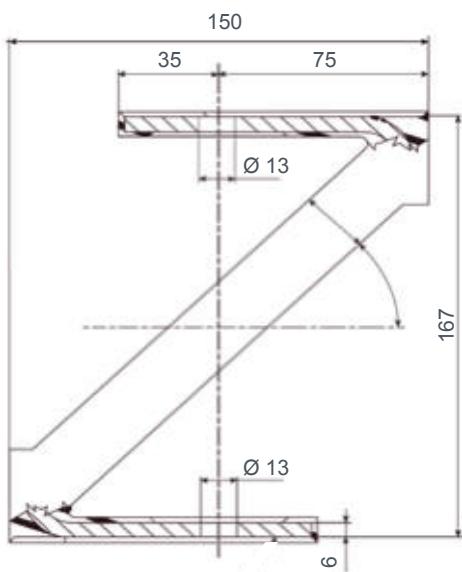

## ADVANTAGES

The mounts provide a high level of vibration isolation and shock attenuation. Their strength is equal to a continuous acceleration of 10g at the maximum load. The range includes 5 references with load ranging from 11 to 94 daN.

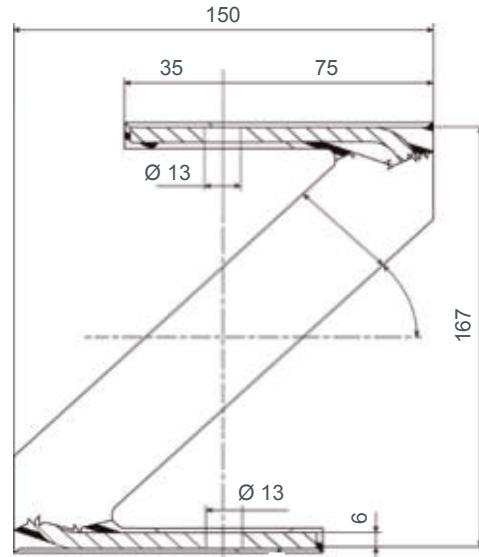

The mounts meet the shock requirements for European and North American specifications. The metalwork is covered with elastomer to protect it against corrosion (ex. : salt fog).

# DIMENSIONS

552454	75	56,3	93,8	37,5	46,9	37,5	46,9

Longitudinal X : No permanent loads should be applied in this direction.

# TECHNICAL CHARACTERISTICS

- Resonance frequency axial and radial : 5 to 7 Hz depending on load.
- Deflection during shock : 75 mm in all directions.
- Mechanical strength : 10 g with maximum load.
- Operating temperature : - 30 °C to + 80 °C.
- Metallic parts are covered with elastomer provide good corrosion resistance when used in a sea water environment.

## ASSEMBLY

In the case of a large cabinet, the mounts can also be used as stabilisers. They should be fixed after the load has been supported by main mountings.

To ensure the mounting system operates correctly all connections should be capable of large displacements. We recommend that installation design should be approved by our technical department.

# Active control systems of noise and vibrations

## INTRODUCTION

Active isolators cancel the incoming vibration by generating a dynamic force of same magnitude in opposite phase through the use of electrodynamic actuators, thus improving the low frequency performance of the suspension.

The objective is to improve the insulation of vibration in the range 10 to 1000 Hz even more – according to the needs of the application.

The applications of STRACTIVE are endless : reactive silencer, electric motor, transformers, internal combustion engines, structures, pumps,...

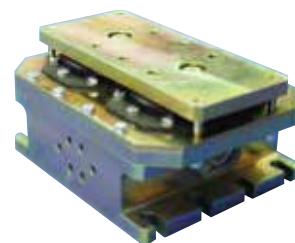

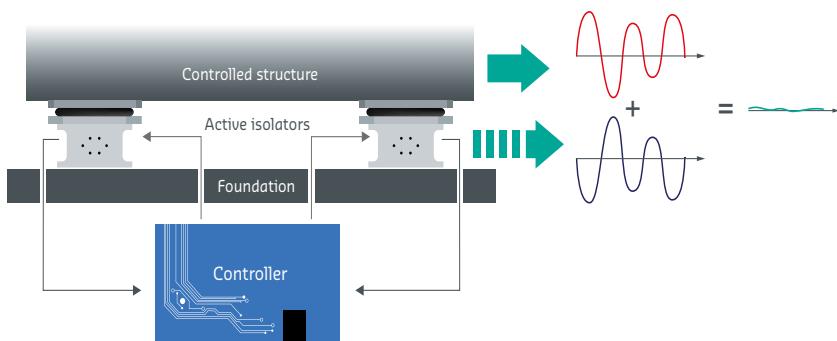

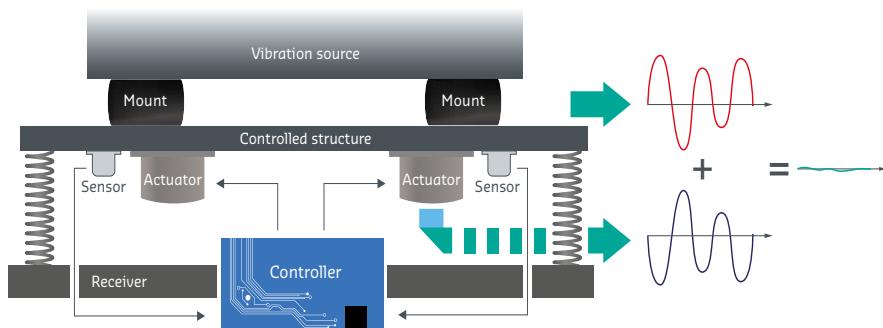

## EXAMPLES OF APPLICATIONS

- Oceanographic research vessel : improves the threshold of sonar detection.
- Extends crew shift.
- Submarines : reduce noises.
- Diesel engines / ventilation systems : reduction of air noises by active silencers.
- Machine tools : improvement of precision and life cycle of manufacturing tools.

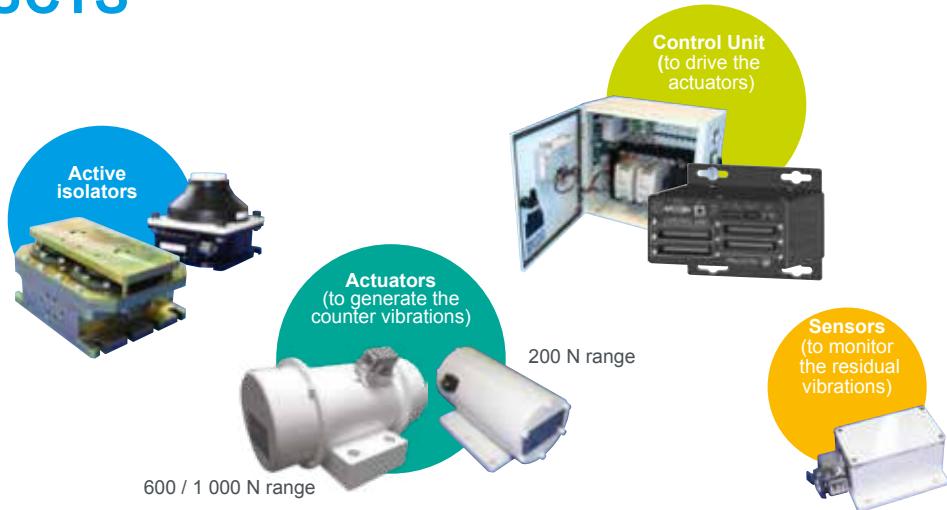

# ADVANTAGES

- To improve dynamic isolation offered by passive suspensions of the same stiffness.
- To improve uncoupling between structures.
- To simplify the installation of the equipment by reducing or eliminating inertia blocks.
- To reduce structural stress and increase life.
- To reduce noise.
- To reduce movement of connections to equipment
- Excellent vibration reduction : 12 to 36 dB of additional filtering compared to the passive solution only.
- Total suppression of the most annoying harmonic.
- Performance upgrade of existing machines with minimum impact (Add-on kit).
- Space & weight saving.
- Improve the professional environment in term of noises and vibrations exhibition.
- Reduce submarines noises.

# STRASONIC® ACOUSTIC FOAM

## DESCRIPTION

STRASONIC® is a range of complex materials designed to provide the best acoustic isolation. Their structure is based on polyurethane foams or cellular rubber.

Their main function is to reduce airborne noise (Isolation, Absorption and Damping) in partial or complete enclosures of machinery.

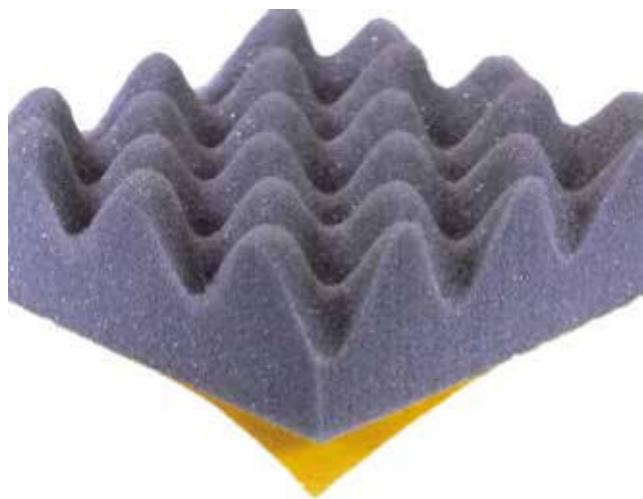

## APPLICATIONS

The STRASONIC® material can be used in a range of applications such as : air conditioning, pumps, presses, compressors, electric motors, diesel engines, generator sets, gearboxes, turbines, agricultural or construction equipment and other machinery.

Due to their design, they are light, easy to handle and a self adhesive side simplifies the installation (depending on the type of foam).

# POLYURETHANE FOAM

CORRUGATED, WITH SELF ADHESIVE LAYER

## DESCRIPTION

**50 mm** of corrugated PU Ether absorption foam. **Self adhesive layer on one side.**  
Temperature range : from - 25°C to + 110°C.  
Fire resistance : M4.

## APPLICATIONS

- Air conditioning
- Fans
- Ventilation shaft
- Pumps
- Presses
- Air compressors

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841000	700	500	50	0,43
841010	2000	1400	50	3,44

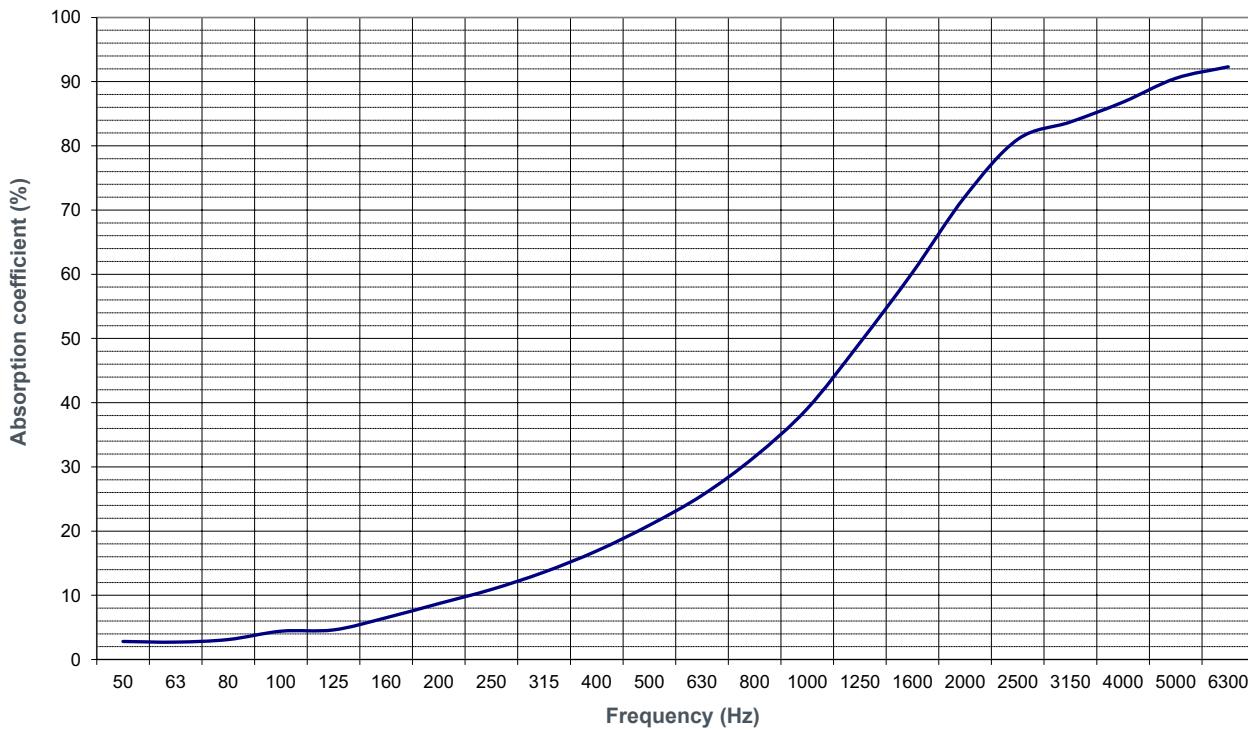

Tolerance : ± 6 mm

# ACOUSTIC PERFORMANCES

Average absorption factor K 65%.

Approximate gain on a 2 mm steel sheet : - 10 dB (A).

The corrugations increase the absorption surface by 40%.

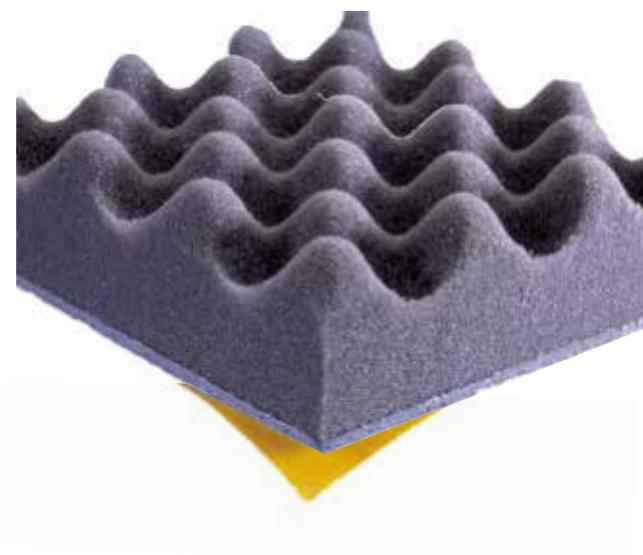

## — 841000 and 841010

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# POLYURETHANE FOAM

CORRUGATED, WITH SELF ADHESIVE LAYER AND HEAVY WEIGHT

## DESCRIPTION

**50 mm** of heavy weight 5 kg/m<sup>2</sup>, corrugated PU Ether absorption foam bonded to **3 mm** of spring foam.

Temperature range : from - 25°C to + 110°C.

Fire resistance : M4.

## APPLICATIONS

- Air compressors      • Compressors
- Gearboxes            • Electric motors
- Presses

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841001	700	500	50	2,13
841001-50*	700	500	50	2,05

\*Self adhesive layer on one side.

Tolerance : ± 6 mm

# IMPLEMENTATION

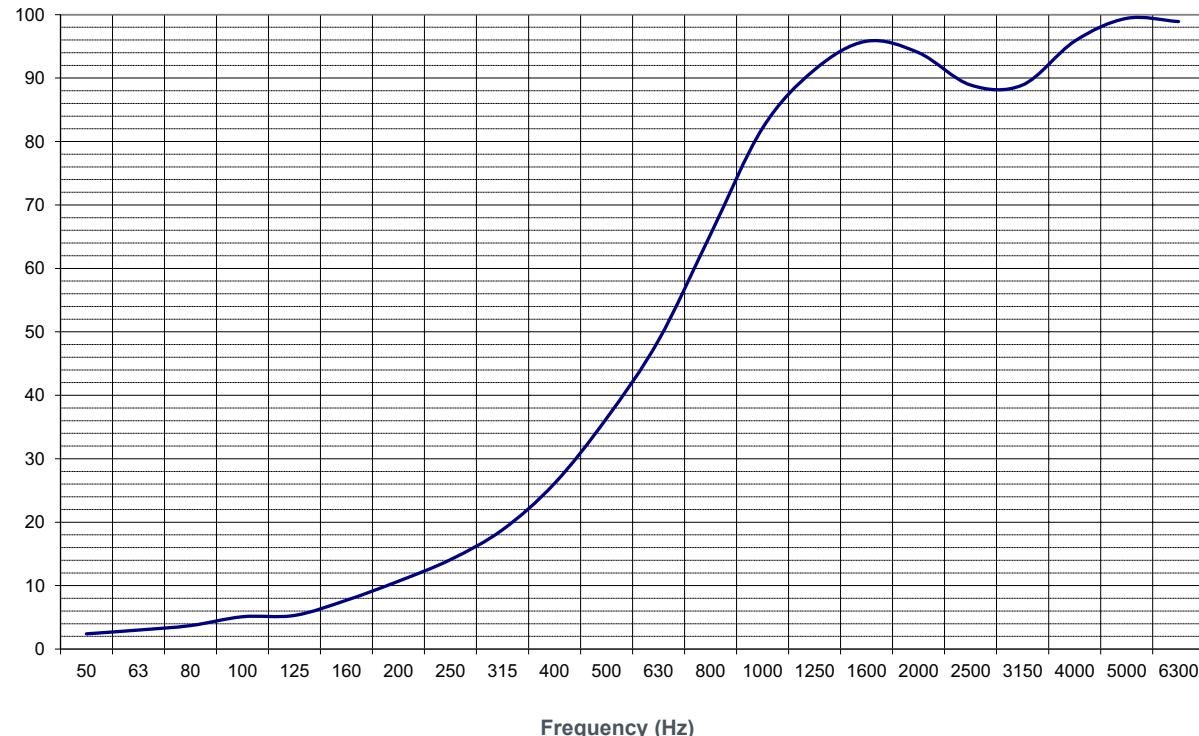

In order to glue foam 841001, we advise you to use a neoprene based adhesive.

## ACOUSTIC PERFORMANCES

Average absorption factor K 68%.

Approximate gain on a 2 mm steel sheet : - 25 dB (A).

Very good performance from 500 to 5 000 Hz.

### — 841001

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# POLYURETHANE FOAM

## HEAVY WEIGHT AND PU FILM

## DESCRIPTION

**100% waterproof black PU film** bonded to 25 mm of heavy weight 5 kg/m<sup>2</sup> corrugated PU Ether absorption foam bonded to **3 mm** of spring foam.

Temperature range : from - 25°C to + 110°C.

Fire resistance : M4.

## APPLICATIONS

- Generator sets
- Agricultural and Construction, equipment machines
- Electric and Diesel engines
- Compressors, Pumps
- Turbines
- Test benches

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841002	700	500	25	1,1
841012	2000	1400	25	8,5

Tolerance : ± 6 mm

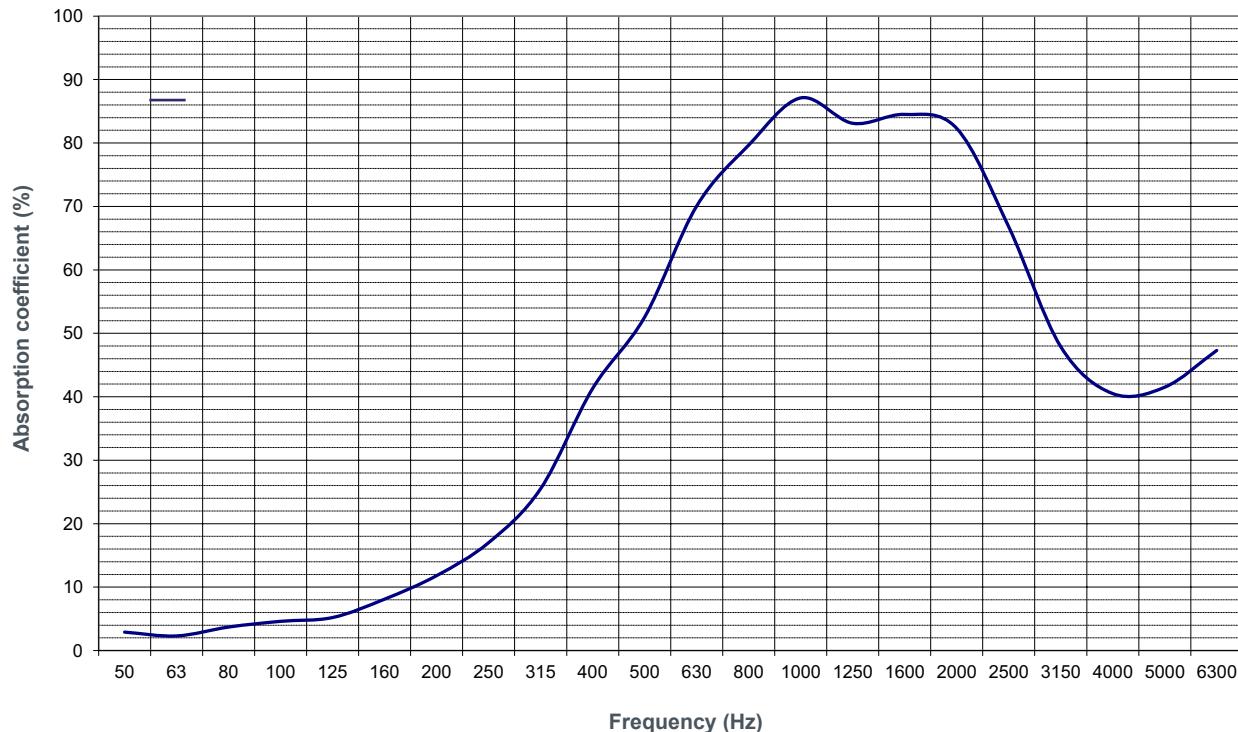

# IMPLEMENTATION

In order to glue foam **841002** and **841012**, we advise you to use a neoprene based adhesive.

## ACOUSTIC PERFORMANCES

Approximate gain on a 2 mm steel sheet : - 20 dB (A).

Very good performance from 125 Hz to 4000 Hz.

### — 841002 and 841012

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# FOAM

## MEETING WITH FIRE STANDARD M1

### DESCRIPTION

Melamine Resin based soundproofing foam, thickness 30 mm, self adhesive layer on one side.  
Temperature range : up to +150°C.  
Fire resistance : M1/UL94 - B1/DIN 4102.  
Classified 0/BS476 6/7.

### APPLICATIONS

- Acoustic and thermal isolation,

Building applications :

- Air conditioning;
- Fans;
- Ventilation shaft;
- Recording studios.

Industrial applications :

- Air compressors, Air exhausts;
- Vacuum pump;
- Injection presses;
- Gearboxes.

### DIMENSIONS

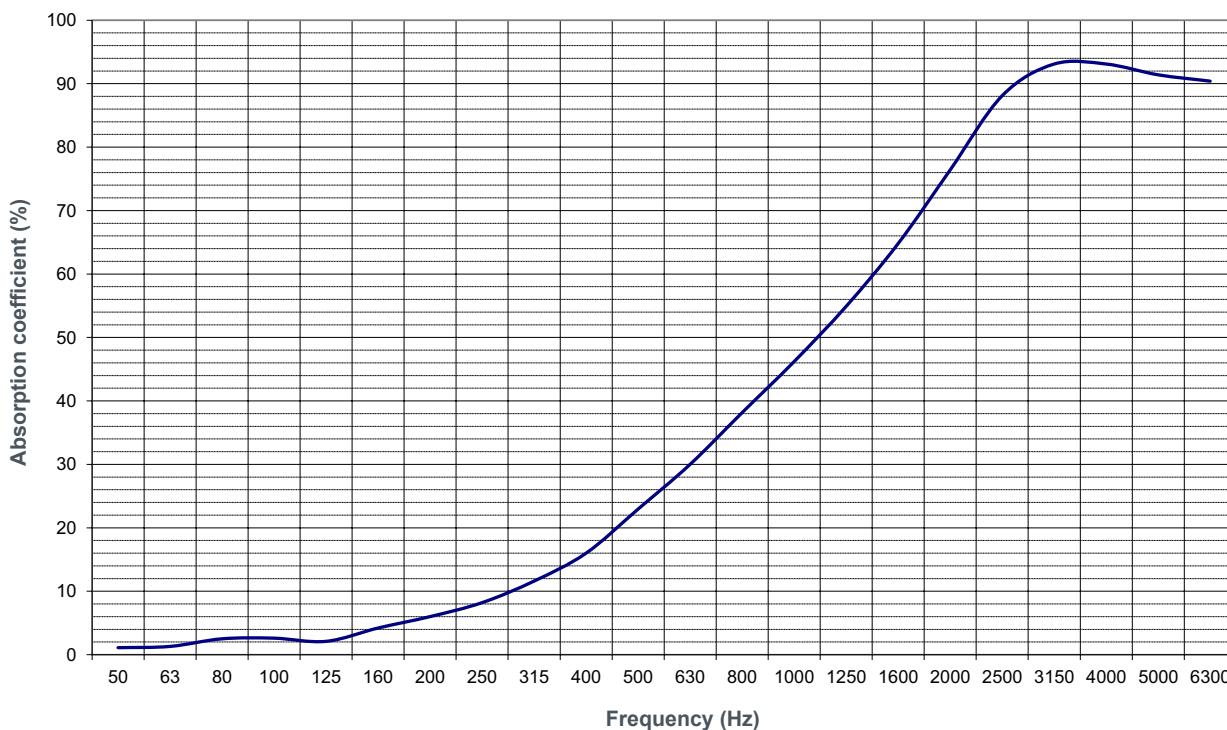

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841006	500	500	30	0,14

Tolerance : + 5 to -20 mm

# ACOUSTIC PERFORMANCES

Average absorption factor K : 85% at 2000 Hz.

Very good acoustic performance in high frequencies above 1250 Hz.

## — 841006

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# RUBBER CELLULAR FOAM

MEETING WITH FIRE STANDARD  
M1/F3

## DESCRIPTION

NBR-PVC based waterproof cellular rubber thickness 30 mm ( $\pm 3$  mm) self adhesive layer on one side.

Temperature range : - 40 °C up to + 90 °C continuous.

Very good resistance to oil. Good fire properties with very few smoke released.

Self extinguishable

Rated : M1/F3 (NFP 92507).

## APPLICATIONS

- Acoustic and thermal isolation,

Building applications :

- Air conditioning,
- Fans,
- Ventilation shaft,
- Recording studios, ...

Industrial applications :

- Air compressors, Air exhausts,
- Vacuum pump,
- Injection presses,
- Gearboxes,...

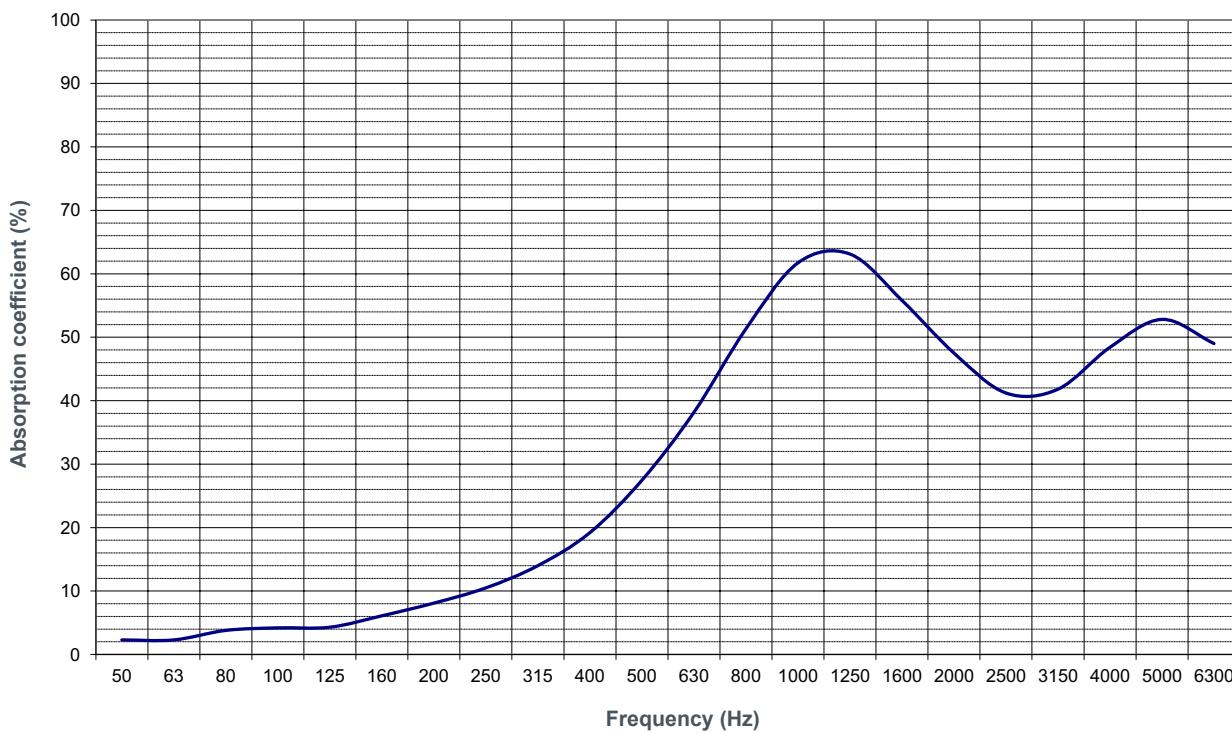

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841007	500	500	30	0,46

Tolerance : + 5 to -20 mm

# ACOUSTIC PERFORMANCES

Average absorption factor K :  $\geq 20\%$  from 600 Hz (increase with frequency).  
Very good acoustic performance in high frequencies above 2000 Hz.  
Approx. gain on a 2 mm steel sheet : - 10 dB (A) at 2500 Hz / - 20 dB (A) at 5000 Hz.

## — 841007

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# CELLULAR RUBBER

## NBR BASED

## DESCRIPTION

NBR based waterproof cellular rubber, thickness 33 mm. **Self adhesive layer on one side.**  
Temperature range static from - 40°C to +105°C continuous.  
Very good resistance to oil, ozone, air and UV.  
Fire resistance : M4/FMVSS 302.

## APPLICATIONS

- Sand blasting systems, Saws
- High speed drills
- Vacuum pumps
- Injection presses
- Gearboxes

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841003	500	500	33	0,53

Tolerance : + 0 to -30 mm

# ACOUSTIC PERFORMANCES

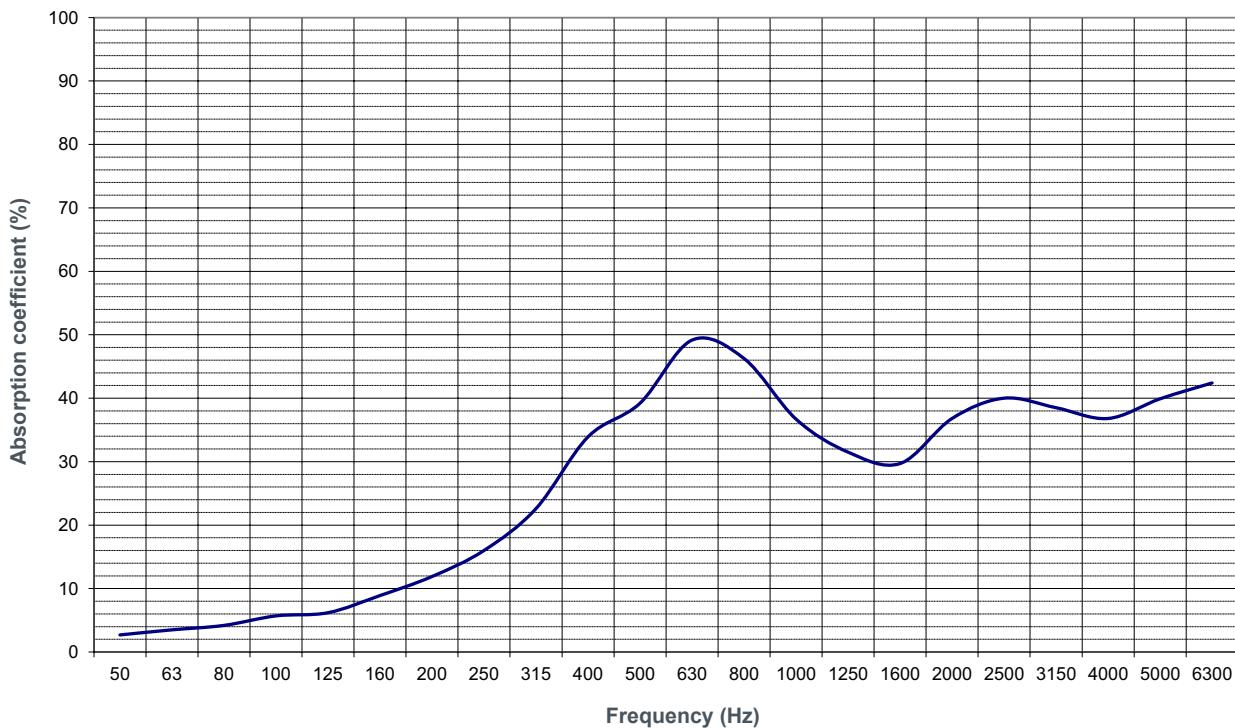

Average absorption factor  $K \geq 30\%$  from 500 Hz.

Very good acoustic performance in high frequencies above 2500 Hz.

Approximate gain on a 2 mm steel sheet :

- 10 dB (A) at 2500 Hz;

- 20 dB (A) at 5000 Hz.

## — 841003

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# CELLULAR RUBBER

## EPDM BASED

## DESCRIPTION

EPDM based cellular rubber with half closed cells.

Thickness **15 mm**.

**Self adhesive layer on one side.**

Temperature range continuous from - 40°C to + 130°C.

Very good resistance to air, ozone and UV.

Very flexible. Good ageing resistance.

Waterproof if slightly compressed.

Fire resistance : FMVSS 302.

## APPLICATIONS

- Air jet positioning
- Sound blasting systems, Saws
- High speed drills
- Vacuum pumps
- Injection presses
- Gearboxes

## DIMENSIONS

Reference	Lenght (mm)	Width (mm)	Thickness (mm)	Weight (kg)
841004	500	500	15	0,51

Tolerance : + 0 to -30 mm

# ACOUSTIC PERFORMANCES

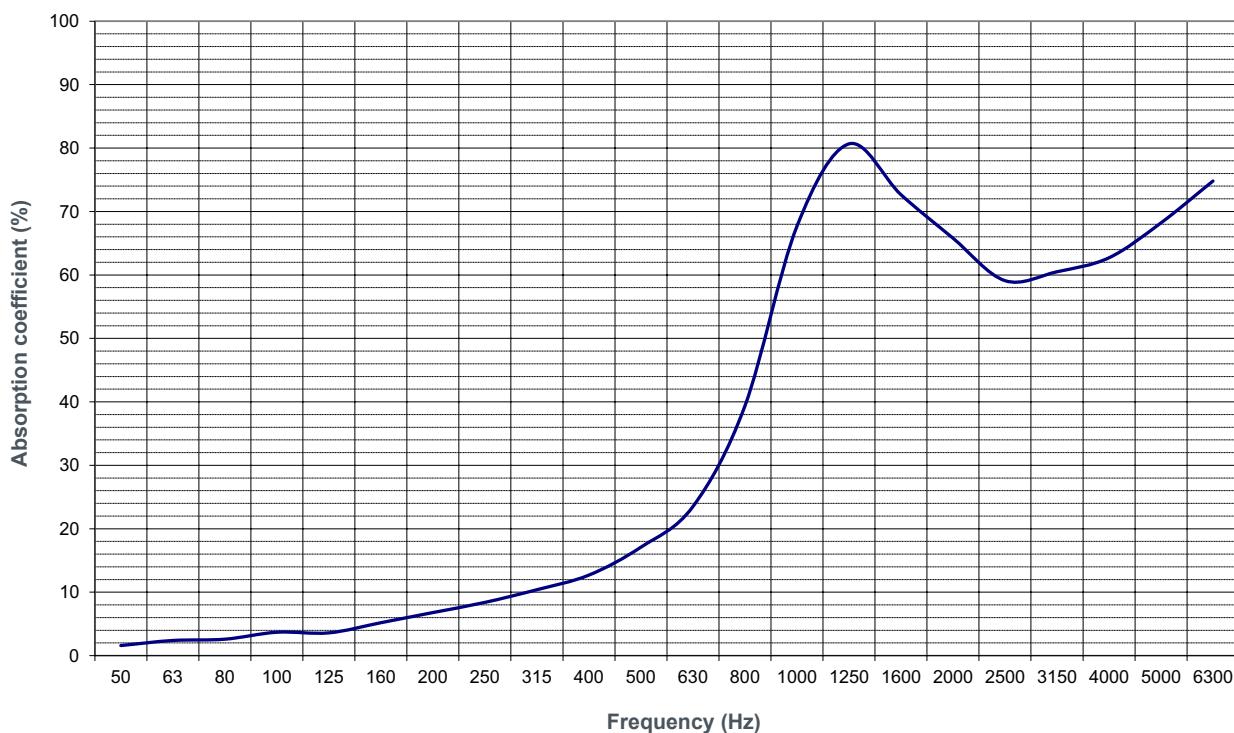

Average absorption factor  $K \geq 30\%$  from 600 Hz.

Very good acoustic performance in high frequencies above 2000 Hz.

Approximate gain on a 2 mm steel sheet:

- 8 dB (A) at 2500 Hz;

- 20 dB (A) at 5000 Hz.

## — 841004

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# CELLULAR RUBBER

## EPDM BASED

## DESCRIPTION

EPDM based cellular rubber half closed cells.

**Thickness 22.5 mm. Self adhesive layer on one side.**

Temperature range continuous from - 40°C to + 130°C.

Very good resistance to air, ozone and UV.

Very flexible. Good ageing resistance.

Waterproof if slightly compressed.

Fire resistance : FMVSS 302.

## APPLICATION

- Air jet positioning
- Sound blasting systems, Saws
- High speed drills
- Vacuum pumps
- Injection presses
- Gearboxes

Average absorption factor  $K \geq 30\%$  from 500 Hz.

Very good acoustic performance in high frequencies above 2000 Hz.

Approximate gain on a 2 mm steel sheet :

- 10 dB (A) at 2500 Hz;

- 27 dB (A) at 5000 Hz.

## — 841005

The measures are made with 3 Kundt's tubes of different diameters to adapt the ranges of frequencies. This experiments are made according to the NF EN ISO 10534-2 standards.

# ACOUSTIC AND THERMIC SILICONE FOAM PAULSTRANE®

## DESCRIPTION

PAULSTRANE® is a mass heavy silicone foam which can be used in all sectors : industry, railway, marine and offshore for phonic protection, thermal and fire in a wide range of temperatures of use.

This solution both well resisting to natural ageing and common main chemical agents. It can be integrated into the side dish of walls, partitions, ceilings, floors and seat (in boats, trains, planes, cars, bus, industrial vehicles / trucks, but also theaters and every noisy places).

## BENEFITS

- Soundproofing.
- Fire protection FAR 25 853 (a) 1 ii) ; FAR 25 856 (a).
- Density and opacity of very low smokes.
- Good resistance in natural ageing (UV, ozone).
- Good resistance in the environment (corrosion, molds, usual chemical agents).
- Range of use : of - 60 in + 200 °C.
- Exist in self-adhesive version (PAULSTRANE SA).

# DIMENSIONS

Type	Reference	Dimensions (mm)	Thickness (mm)	Weight/Surface (kg/m2)
PAULSTRANE / 1,2	820340 00 10	1400 x 975	2,5	1,2
PAULSTRANE SA / 1,3	820349 00 10			1,3

## TECHNICAL CHARACTERISTICS (according to testing method A.S.T.M.)

### PROPERTIES

- Density  
500 kg/m<sup>3</sup>
- Weight  
from 1,25 to 5 kg/m<sup>2</sup>
- Temperatures of use  
of -60 °C in +200 °C
- Thermal conductivity  
at 50°C : < 0,15 W/m.K  
at 100°C : < 0,15 W/m.K  
at 200°C : < 0,15 W/m.K
- Fire resistance  
Vertical burn : FAR 25 853(a)(1)(ii)  
Radiant Panel : FAR 25 856(a) appendix F leave VI
- Environment resistance  
to oil and solvents : excellente  
to the corrosion : excellente  
to the mold : excellente
- Storage conditions  
max 30°C, 50% RH (for PAULSTRANE SA)

Test at 890 °C

# STRUCTURAL DAMPING SYSTEMS

## DESCRIPTION

This damper is made of an high damping material bonded on an aluminium plate. A self adhesive layer on the elastomer to ease the installation. This product will reduce vibrations and noise. The damping is due to the shearing of the high damping layer.

## APPLICATIONS

This damper is designed to face structure borne noise (engine compartments, cabs, bodyshells,...). Its limited thickness ease its installation in confined areas.

## CHARACTERISTICS

- Part number : **820248 (300 x 200 mm).**
- Total thickness : 1.5 mm.
- Weight : 0.2 kg by sheet.
- Temperature range : - 30°C to + 80°C with maximal damping at ambient.

## INSTALLATION

The surfaces must be clean and dry. An acetone type solvent or equivalent can be used for cleaning. Cut the sheet to the appropriate size. Remove the adhesive protection and lay the sheet on the surface avoiding any air bubble.

In case of an installation on a curved surface, or with an edge, we recommend you to give the right shape to the sheet with the adhesive protection in place.

We make it ***possible***

# VIBRACHOC RANGE

## 1 - METAL MOUNTING SYSTEMS

VIBRACHOC have a range of all steel mountings whose essential element is the “**steel cushion**” made from compressed woven or knitted stainless steel wire mesh.

Metal mounts have considerable mechanical strength as well as high damping characteristics in the order of 10 to 20%, depending on the application.

### **Advantages**

**Stability.** Steel mounts provide stable characteristics and the height under load remains constant with time.

**Unaffected by corrosion.** Steel dampers are unaffected by oil, grease, solvents, adverse weather and corrosive products.

**Unaffected by temperature.** Steel dampers withstand temperatures from - 70°C to + 300°C without changing characteristics.

**Low natural frequency.** Steel mounts with springs can have natural frequencies as low as 3 Hz, which can provide up to 98% attenuation for low speed rotating machinery.

## 2 - GENERAL INFORMATION ON VIBRATION AND SHOCK

### 2.1 Purpose of an elastic suspension

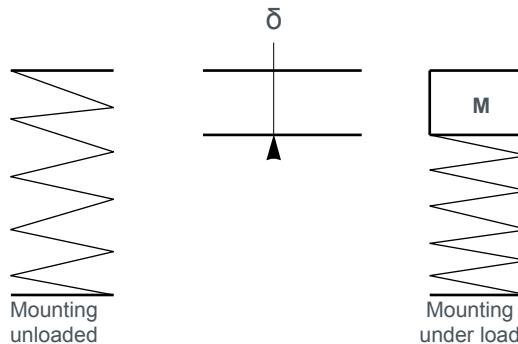

An appropriate elastic mount placed between the support and the equipment usually fulfils two functions :

- it has an important static role: it provides better load distribution by absorbing certain manufacturing tolerances, thus allowing more reliable, cheaper installation;
- it has a dynamic role : it provides protection against vibration and shock, considerably reducing the surrounding vibration and increasing the life time of the equipment isolated.

### 2.2 Theory

#### 2.2.1 Natural frequency

An elastic mount characterised by its load-deflection curve. The load produced by a mass  $M$  causes a static deflection  $\delta$  (difference between the unloaded height and the height under load) and a subtangent  $\Delta$ .

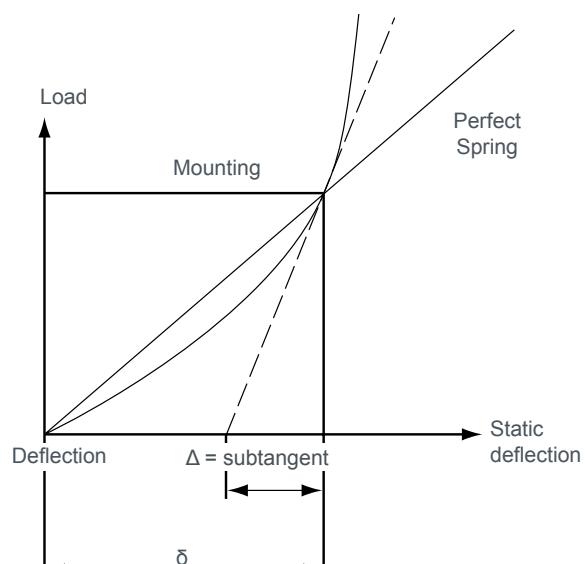

The Natural frequency of the suspended mass is given by the formulae

$$f \text{ in Hz } f = \frac{1}{2\pi} \sqrt{\frac{K}{M}}$$

$K$  = stiffness of the mounting in N/m

$$M \text{ in kg } f = \frac{15,8}{\sqrt{\delta}}$$

$\Delta$  = dynamic deflection in mm

The load-deflection curve is linear for a theoretical spring but is not necessarily linear for a mounting. The form of the curve is highly variable and depends on the design and materials of the mountings.

## 2.2.2 Natural frequency

The purpose of a mount is to reduce the transmission of excitation forces between the suspended mass and the foundation. The degree of attenuation obtained depends firstly on the natural frequency of the mount or, more exactly, on the ratio of  $f_e$  (excitation frequency) to  $f_0$  (natural frequency).

In the simplest case, that of a single degree of freedom (vertical translation), the natural frequency of the mass + isolator without damping and is written

$$f_0 = \frac{1}{2\pi} \sqrt{\frac{K}{M}}$$

$$f_0 = \text{Hz}$$

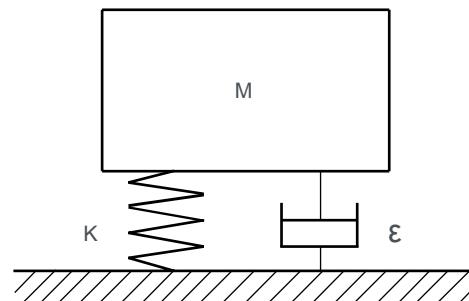

$K$  = Stiffness of isolator in N.m

$M$  = Kg

Model of an elastic mount

$K$  = stiffness

$e$  = damping

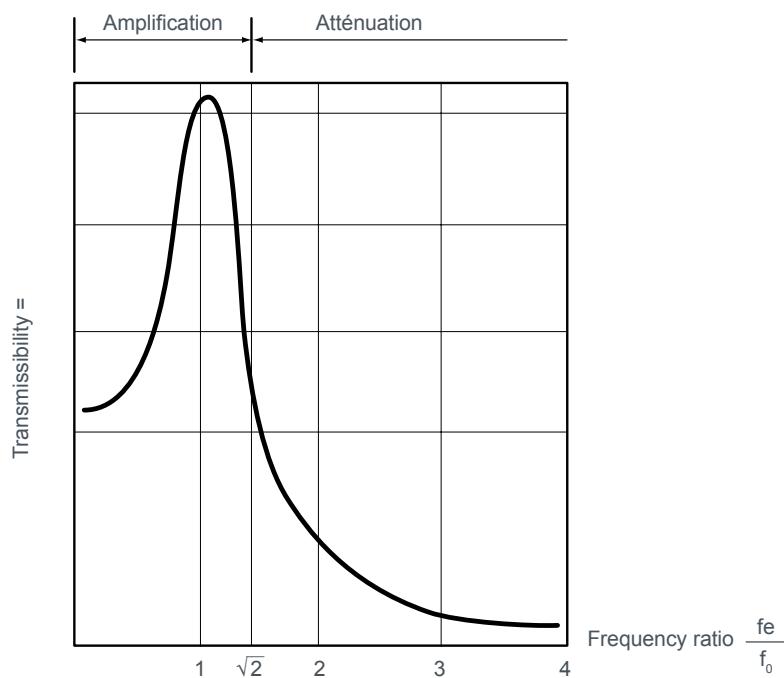

Transmissibility is the ratio of the transmitted force  $f_p$  to the excitation force  $f_e$ . Examination of the curve opposite shows that :

- for  $f_e/f_0 < \sqrt{2}$  and in particular when the natural frequency of the mount is greater than the excitation frequency, there is amplification of vibration rather than attenuation.

This illustrates the fact that the selection of unsuitable resilient mount makes the problem worse rather than solving it.

- for  $f_e/f_0 > \sqrt{2}$ , the excitation is attenuated. This shows the advantages of using a mount with a natural frequency ( $f_0$ ) as low as possible in relation to the excitation frequency ( $f_e$ ). The greater the difference, the higher the degree of attenuation.

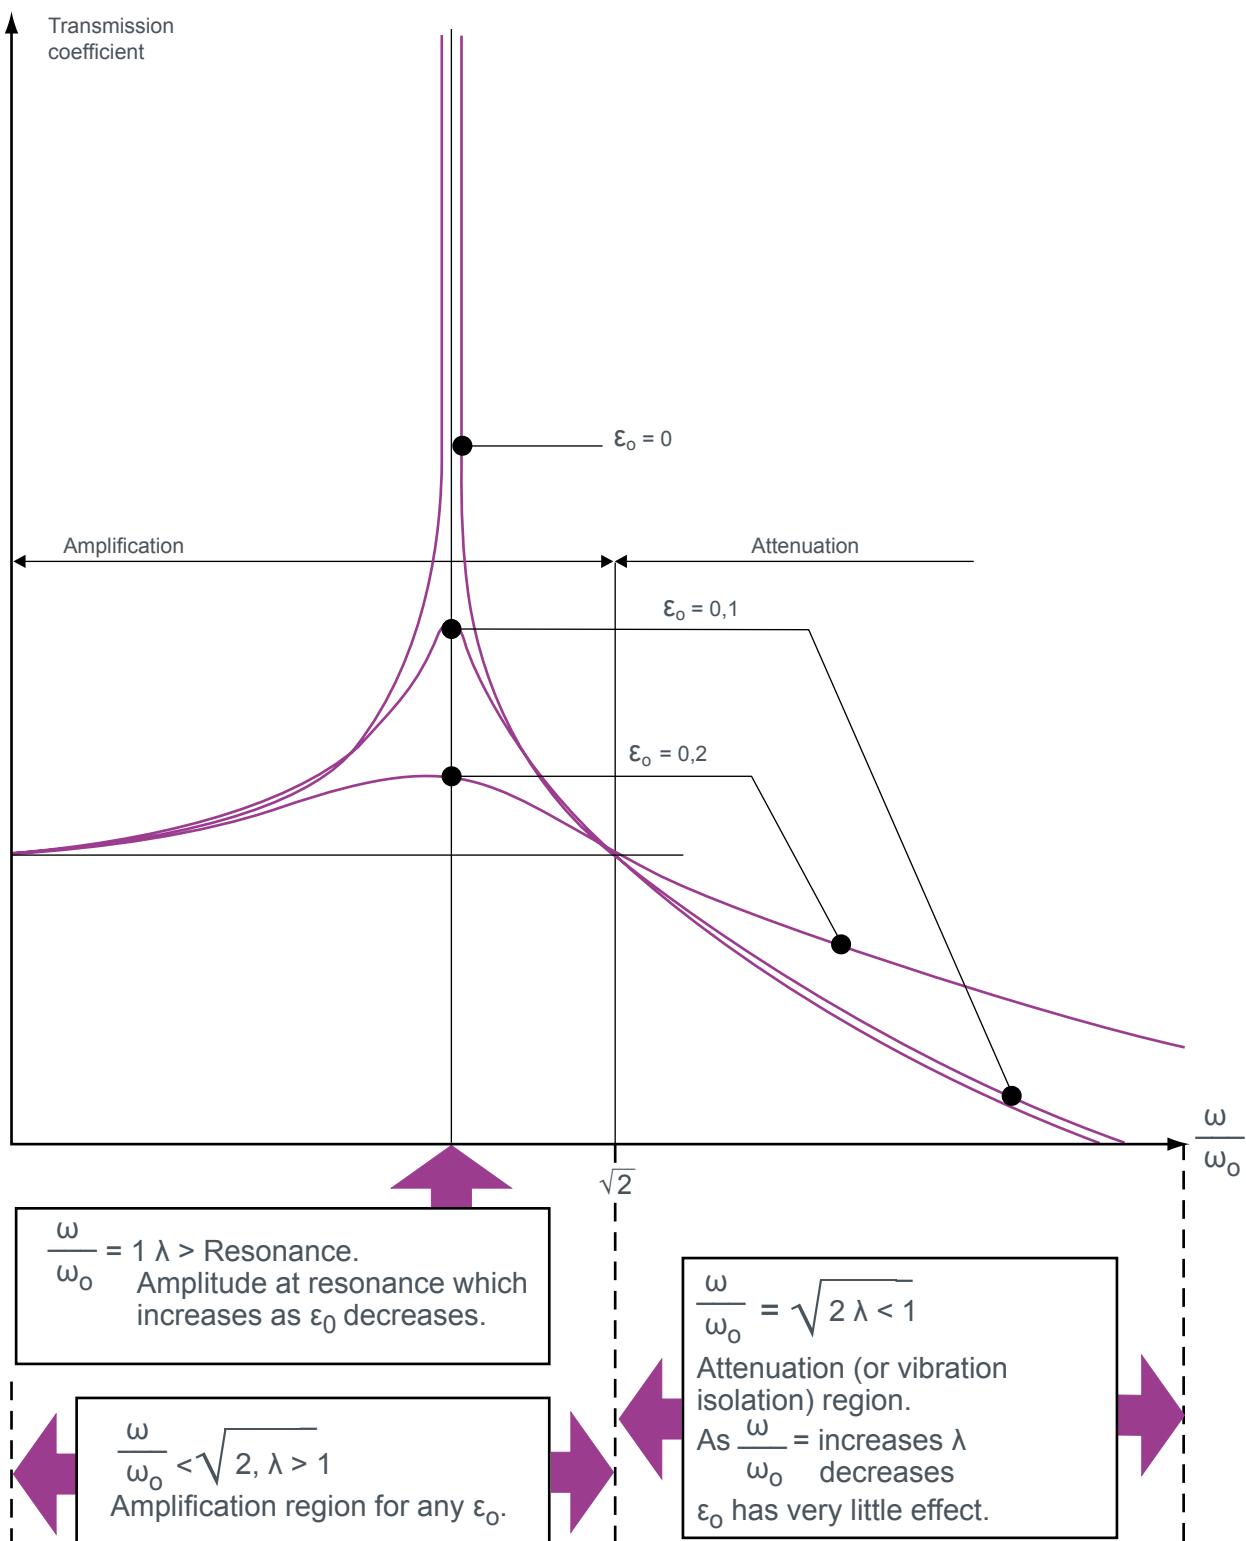

## 2.2.3 Damping

Damping dissipates vibrational energy by dry or viscous friction and acts as a brake, preventing displacement of the suspended assembly.

It can be seen that :

- for  $f_e/f_0 < \sqrt{2}$ , the amplification decreases with higher damping, particularly when close to resonance;

- for  $f_e/f_0 > \sqrt{2}$ , attenuation improves with lower damping.
- To limit amplification at resonance while achieving good attenuation, it is necessary to find a good compromise when choosing a damper.

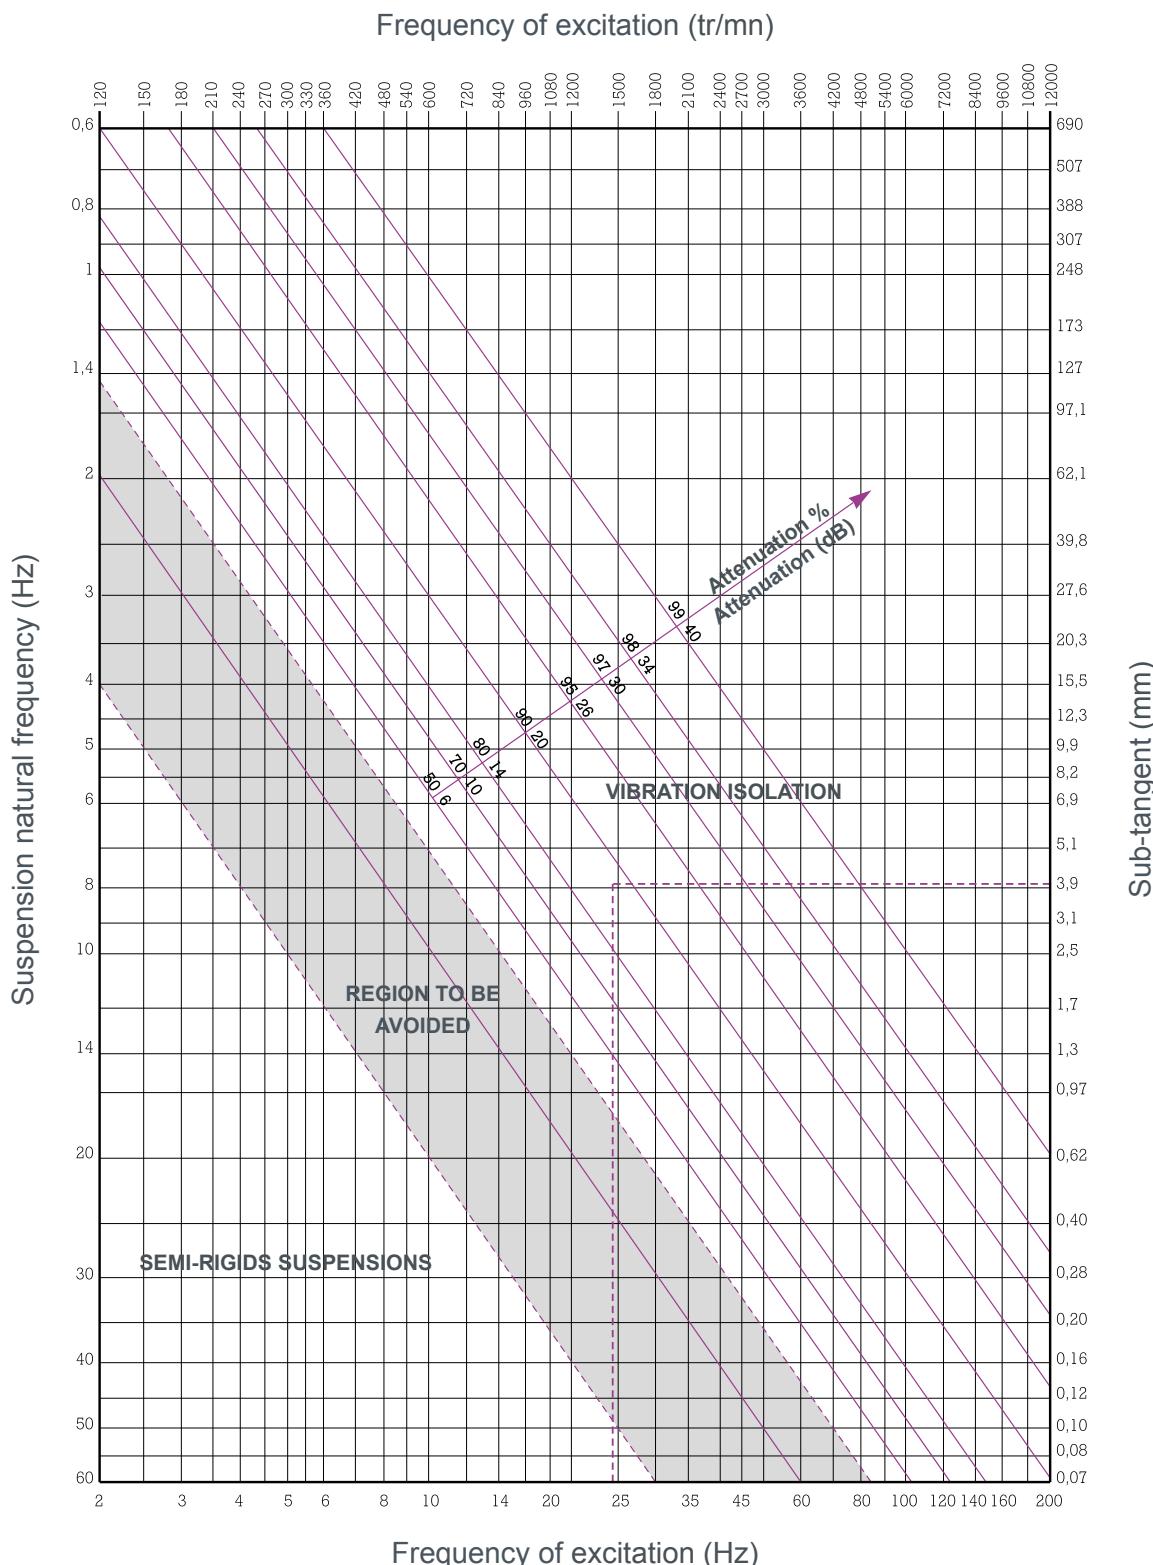

For an efficient mounting system use :

a high value of  $\frac{\omega}{\omega_0}$  → low value of  $\omega_0$  → low value of  $\lambda$

a high value of  $\varepsilon_0$  → - limited amplification in the resonant region;  
- minor effect in the attenuation region.

# ABAQUE

**Attenuation as a function of natural frequency and frequency of excitation  
(A theoretical graph for a mounting system without damping)**

- Select the running speed (rpm) or frequency of excitation (Hz) of the equipment to be mounted, on the horizontal axis.
- Project a vertical line to intersect with a horizontal line which passes through the natural frequency of the mounting system selected.
- Where the two lines intersect, follow a diagonal line to find the level of isolation for the mounting system chosen.

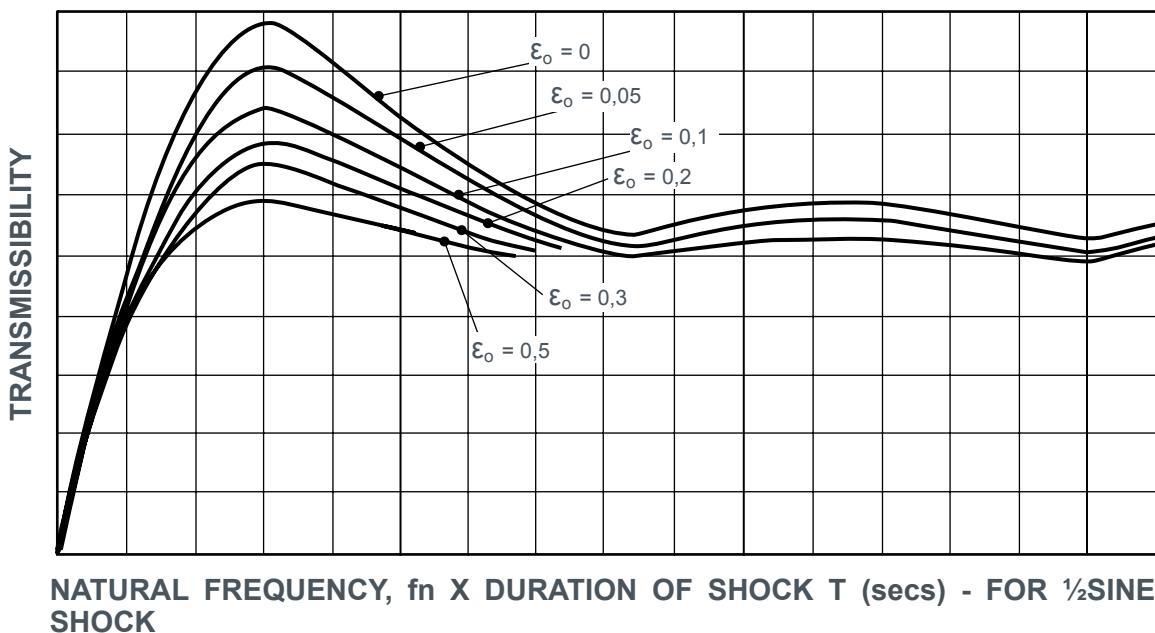

## 2.2.4 Shock

For impact machines like presses, forging hammers, etc, excitation is generated in the form of individual very short-time based shocks. In the same way as for vibration, where the importance of the relationship of  $f_e$  to  $f_n$  is paramount in determining the attenuation provided, here it is the  $f_n/f_s$  relationship ( $f_0$  : natural frequency of the mounting -  $f_s$  : shock frequency) which as to be considered.

We can deduce from these curves that :

- to obtain attenuation of a  $\frac{1}{2}$  sine shock ( $T < 1$ ) the  $f_n/f_s$  ratio must be approximately less than 0.30. Beyond this limit the excitation force is amplified. Thus for a shock lasting 0.02 second, the resonant frequency of the isolators chosen must be as low as possible and in any case must be lower than 7.5 Hz;
- the presence of damping between 0 and 0.5 of critical contributes to the attenuation of a shock, but this improvement is slight for  $f_0/f_s < 0.3$ .

The influence of the damping effect will be all the greater in the case of multi-frequency excitation where it is not always possible to select a natural frequency well away from the excitation frequencies. This is also true when searching for a compromise between shock attenuation (force transmission) and the limitation of displacement.

# 3 - VIBRACHOC RANGE APPLICATIONS

## Industry

- Isolation of rotating machinery
- Isolation of machine tools
- Protection of works of art

## Defence

- Protection of vehicle mounted electronics (tanks, shelters, off-road vehicles)
- Protection of inertial platforms, guidance systems, fire control and command and control electronics
- Protection of missiles, their associated equipment and components

## Marine and naval

- Suspension of motors, engines, structures, and exhaust systems
- Protection of electronic cabinets
- Discrete acoustics

## Aerospace

- Protection of electronics
- Helicopter lead lag dampers and laminated bearings
- Mounting for onboard avionics
- Engine and APU Mounting Systems

## Rail

- Protection of train mounted electronics
- Suspension of train mounted equipment (forms, air conditioners, transformers)
- Improved acoustics (suspension of bay front panel, floors ...)

## Civil engineering

- Suspension of fans and air conditioning systems
- Suspension of floors
- Suspension of pipes and ducting

## 4 - INDUSTRIAL APPLICATIONS OF THE VIBRACHOC RANGE

### 4.1 Machine tools and impact machinery

- Lathes, horizontal and vertical mills, tapping machines, drills, etc.
- Hydraulic and mechanical presses, shears, etc.
- High speed presses, power hammers, etc.
- Printing machinery, textile machinery, etc.

#### Suspension of machine tools

For example, lathes, drills, mills, planes, mortise cutters, saws, grinders, nibblers, gear cutter, borers, tapping machines, etc. The machinery is isolated actively (attenuation of the vibration generated by the machine) and passively (the machine is protected from floor vibrations).

- Vertical natural frequency between 20 and 25 Hz, provides excellent attenuation of the vibration spectrum, very effective for this type of machinery.
- Various assembly possibilities : integral levelling, non-slip base, fitting under machinery that does not have any mounting holes, etc.

#### Suspension of machinery for forming materials

For example : shears, folding machines, presses for punching, stamping, pressing and embossing, machinery for making nuts, hydraulic and mechanical presses, etc.

This type of machinery operates mainly by delivering blows and the shocks generated, which are sometimes significant, have to be absorbed by dampers with both a considerable capacity and high mechanical strength. The noise propagated to the structure is also noticeably reduced.

#### Suspension of high speed presses

The suspension has to avoid transmitting shock to the floor while maintaining the stability of the machine, particularly for automatic feed.

The dampers must be selected to avoid resonance with the machine speed :

- the machine speed may vary from 0 to 600 cycles/min;
- if the speed is greater than 250 cycles/min, highly efficient isolation is obtained by using very low frequency mountings. An integrated damping system is usually necessary (metal pad, fluid dampers, etc.).

## 4.2 Rotating and vibrating machinery

- Engines, generators sets, compressors, fans, crushers, centrifuges, dryers, pumps, etc.
- Sieves, riddles, engine test benches, pipework, etc.

### Suspension of well balanced rotating machines

This category includes most rotating machines, which develop free forces during operation which are quite low in comparison with their mass, such as : generator sets, air conditioning plants, most engines, fans (in clean air), compressors, pumps, etc.

The choice of mounting depends mainly on the speed of rotation of the machine and the degree of attenuation required. The natural frequency of the mounting must be low for slow rotational speed and high attenuation.

The antivibration mounting protect the machine without using an inertia mass. However, the engine should be mounted on the same chassis as the driven equipment if they are not already mounted in this way, to avoid excessive stress on the couplings.

### Suspension of rotating machines with high dynamic forces

Grinders, centrifuges, dryers, certain types of reciprocating compressors, pumps, engines (with 2 or 3 cylinders), etc. may generate very high forces (such as eccentric loads, unbalanced forces or torque, start-up and short-circuit torque, etc.) during operation which may affect their stability and the various connectors and hoses. It is essential to limit the displacement of the suspended equipment by ensuring that the anti-vibration system is properly designed:

- the mountings should include dampers such as metal pads, damping fluids, etc.;
- an inertial mass may be incorporated, but only if the damping obtained is insufficient to stabilise the equipment.

The design of the mounting system must cover all aspects and be carried out from the start of the equipment installation design to define the supporting structures accurately at a sufficiently early stage.

Consult us for particular solutions.

### Passive suspension of rotating machines

Certain types of compressors are perfectly balanced and do not generate any significant vibration. However, their operation and setting are so sensitive to vibration or shock (nearby workshops, handling, etc.) that they need passive protection.

The machine should be mounted on an inertial mass suspended on mountings with springs and metal pads.

### Suspension of on-board rotating machines

On board lorries, trailers, trains, road and rail vehicles, boats, etc.

In addition to active protection, the machine needs to be protected against shocks and vibrations generated by the vehicle.

“Captive” mountings are usually used. They have travel limiting stops in all directions to ensure absolute safety while the vehicle is moving.

### **Suspension of vibrating machinery**

Suspending sieves, vibrating riddles, etc... is more complex because these machines already have elastic couplings (e.g. springs) which assist operation.

If the machine is suspended on vibration mountings, it becomes a two-stage vibration system. When designing these systems the natural frequency of the elastic couplings within the machines as well as any flexibility in the chassis have to be taken into account.

### **Suspending engine test benches**

This type of equipment poses a special vibration problem:

- the forces generated may be very high and sudden;
- the equipment must be able to be used with engines that vary considerable in size, weight and power.

An effective solution is to use an inertia mass suspended on very low frequency mountings with adequate integral damping.

## **4.3 Vehicles**

- Civil engineering plants
- Handling equipment
- Trucks
- Trailers
- Road vehicles
- Railway engines

Particular attention must be paid to elastic mountings for equipment on civil engineering plant and vehicles in general. **The relative elasticity of the structures must often be taken into account as they can generate low or very low frequency vibration as a result of shocks arising from the work or movement.**

To be effective, the elastic mounting, must, therefore, be carefully designed.

The following examples, in particular for cabs, seats and equipment, are given for illustration only. The right solution may vary considerably from one machine to another.

### **Suspension of propulsion systems**

The problem here is to minimise the vibration and noise generated by the engine through the structure of the vehicle (structure borne).

The disturbing frequencies vary from 10 to 100 Hz (and harmonics) for engines and 120 to 400 Hz for gear boxes.

The damping system should usually have :

- a low (isometric) resonant frequency (if possible 6-8 Hz);
- a limited displacement under extreme forces (system with very progressive stiffness);
- considerable low frequency damping and as low as possible above 100 Hz.

## 4.4 Marine - offshore

The vibration and noise on board ships is generated by :

- the system of propulsion: the alternating hydro-dynamic forces generated by the propellers pass through the hull, usually creating low frequency vibration;
- the main engines and auxiliary engines which transmit vibrations to the hull via the structure : the spectrum is usually in the 15-50 Hz region;
- the exhausts : spectrum 16-8000 Hz;
- the effects of the sea : swell, heavy seas, wind;
- accidental shocks against the quays.

Regulations have been drawn up to protect the crews, passengers and equipment from discomfort caused by shocks and noise.

**The VIBRACHOC range provides a comprehensive selection of means for complying with the standards and regulations for vibration and noise on ships (ask us for details).**

### Suspension of main engines and auxiliary engines

The main engines and auxiliary engines transmit vibrations to the structure of the ship. They also emit noise :

- directly into the air;
- indirectly, as the structures linked rigidly to the engine themselves become sources of transmitted noise.

Mountings (dampers) at strategic places between the engine and the structure significantly reduce the structure borne vibration and noise.

Many parameters are required for calculating the suspension required for marine engines : the rotation speed of the engine, the number of cylinders, the number of blades on the propeller, the natural frequency of the hull, the elastic coupling characteristics, the roll, the pitch and the maximum permitted forces. The technical service of Paulstra has several computer calculation programmes to define the most suitable suspension.

An extensive range of all metal or elastomer based dampers is available for mounting all kinds of engines :

- **diesel engines** of all sizes for merchant ships, war ships or pleasure boats;
- **auxiliary engines**, generators, pumps, compressors, windlasses, etc.

### Suspending exhaust pipes

The turbulent gases circulating in exhaust pipes are a source of vibration and noise.

Using elastic mountings to anchor exhaust pipes from diesel engines has the advantages of :

- reducing the vibrations transmitted to the structure of the ship;
- attenuating the global noise in areas near the funnels, by between 5 and 20 dB (A);
- eliminating expansion compensators, as the mounting allows free expansion of the ducts;
- eliminating the deformation of the pipes caused by rigid mountings. The suspension of an exhaust pipe usually requires supports and stabilisers.

### Suspension of on board equipment

Elastic suspension of sensitive on-board equipment (radio, navigation, electric or electronic enclosures, control panels, etc) provides protection against vibration coming from the structure.

On board warships, high deflection mountings also provide protection against shocks from mines, etc. Stabilisers have to be added to supporting dampers for tall enclosures or racks.

## 4.5 Buildings

The problem of preventing vibration caused by air conditioning, ventilation, compressor or pumping systems, etc, in housing (flats, hotels, etc) offices or factories is now becoming more common for two reasons :

- 1) there is a general tendency to reduce the vibration and noise levels to comply with new noise regulations;
- 2) there is also a general tendency to build lighter constructions with greater spans, implying greater floor flexibility.

Active damping of machinery by preventing vibration being transmitted through the structure of buildings is often a way of complying with these regulations. The mechanical vibration filtered by VIBRACHOC mountings is transmitted at a level that is too low to excite structures that could create noise.

### **Suspension of foundations of lifts, hoists, etc.**

The vibration generated by the winch while operating a lift has to be damped but it is especially important to absorb the shock generated when the machine starts or brakes. This often requires the use of elastic systems with good damping.

### **Suspension of fans, air conditioning, compressors, pumps, etc.**

An elastic suspension provides good protection against vibration, **while, in most cases, avoiding the need for concrete masses, a costly solution** which prevents the equipment being moved easily.

The vibration and noise generated by a machine are more of a nuisance to the environment if they are positioned at a structurally weak point (roofs, terraces, floors, etc) and near offices or flats.

The rigidity of the floor is a factor that has to be taken into consideration when deciding which type of suspension to use.

### **Suspension of floating slabs**

An economical solution is not to mount each machine separately but to group all the equipment likely to cause vibration on one slab, said to be floating because it is linked to the structure of the building by very low frequency mountings.

This system considerably increases the inertia of the suspended part and thus significantly reduces the displacement of the slab.

### **Suspension of pipework and conduits**

Pipes and conduits generate two types of vibration :

- low frequency vibration due to turbulent flow (8-15 Hz);
- high frequency vibration due to the vibration of the pipes themselves (above 25 Hz).

The suspension usually also has to withstand quite high temperatures and allow the pipes to expand freely, which means that elastic all metal and/or telescopic systems have to be used.

We make it **possible**

# METALLIC CUSHIONS

Natural frequency : (1)  
12 to 25 Hz

## DESCRIPTION

Metallic cushions are made from drawn, woven stainless steel wire that is compressed into a geometric shape.

The Vibrachoc range has more than 1000 standard metallic cushions of various sizes and characteristics.

As metallic cushions are easy to create, custom shapes and characteristics can be developed and produced on request.

## APPLICATIONS

Standard or custom metallic cushions can be used for many industrial applications because they are naturally resistant to grease, oil, water, etc and withstand temperatures from - 70°C to + 300°C.

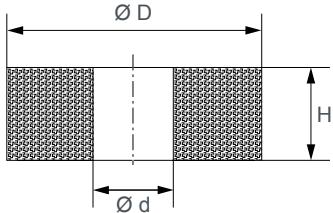

The static stiffness of the metallic cushion ensures progressive stiffening and maintains a constant natural frequency for a very wide range of loads within a small space.

Their natural frequency of between 12 and 25 Hz and damping of 15 to 20% make them suitable for mounting rotating machines with a rotation speed over 2000 rpm.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# OPERATING CHARACTERISTICS

## TYPICAL STIFFNESS CURVE FOR A METALLIC CUSHION

Δ<sub>1</sub> : subtangent at minimum load M<sub>1</sub>.  
Δ<sub>2</sub> : subtangent at maximum load M<sub>2</sub>.  
Δ<sub>1</sub> = Δ<sub>2</sub>

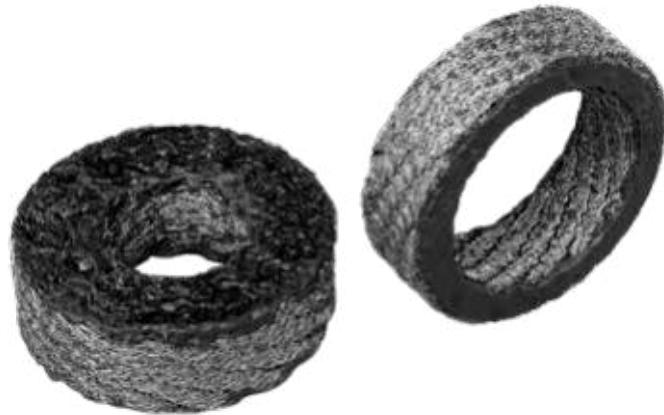

Natural frequency of the mounting remains constant in the load zone.

The elastic limit of the metallic cushion under compression is 3 to 5 times greater than the maximum static load shown in the data sheets.

- 1 - Excellent resistance to oil, grease, solvents, water, dust, chemical agents.
- 2 - Whistands temperatures from - 70°C to + 300°C and in certain applications - 150°C to + 400°C.
- 3 - Highly resistant to ageing : characteristics are stable.
- 4 - High damping from 15 to 20%, i.e. tan. δ from 0.3 to 0.4 corresponding to an amplification factor at resonance < 4.
- 5 - Loading up to 150 kg/cm<sup>2</sup> under compression and 500 kg/cm<sup>2</sup> for isolating shocks.
- 6 - Natural frequency between 15 and 25 Hz.

# VIBSOL®

Natural frequency : (1)  
15 to 30 Hz

## DESCRIPTION

The VIBSOL mount is made of a round metal cushion covered with an anti-slip elastomer pad on both sides.

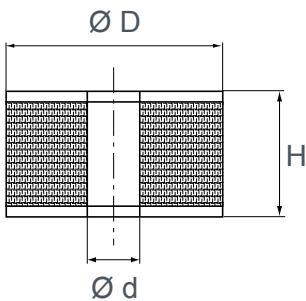

- It is available in two versions :
  - a standard version with a natural frequency of 22 to 30 Hz (machine tools);
  - a thick version (W) with lower stiffness and a natural frequency of 15 to 22 Hz (metal forming machines).

## APPLICATIONS

- The VIBSOL mount is a simple and quick solution for machine tools offering a good shock absorption, and easy to install by sliding it under the base of the machine.
- Unaffected by oils, cutting fluids, detergents, high and low temperatures with good resistance to fatigue.
- It offers good stability for the suspended machine.
- A constant natural frequency over a wide load range makes mount selection easy.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# OPERATING CHARACTERISTICS

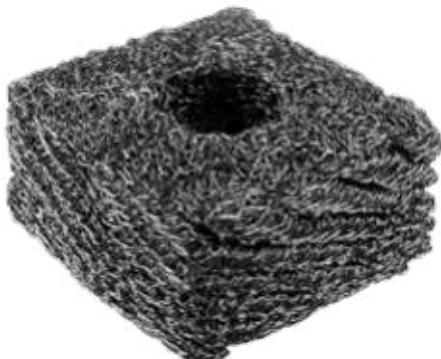

# **VI786 - A06**

# **VI700 - A06**

# **VI700 - B06**

Natural frequency : (1)  
15 to 20 Hz

## **DESCRIPTION**

This suspension system consists of rectangular cushions made of woven compressed stainless steel wire. The VI786 have a Ø 9 bored screw hole, so that they can be mounted in collars with the diameters required by the user.

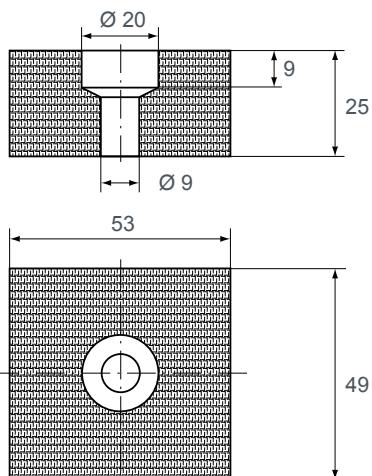

## **APPLICATIONS**

This suspension system is particularly suitable for mounting exhaust pipes from generator sets on board ship or permanently mounted in buildings. They are unaffected by aggressive chemicals, oil, grease and corrosion and withstand extreme temperatures from - 70°C to + 300°C.

The natural frequency of between 15 and 20 Hz enables the pipes to be mounted independently of the support and thus reduces noise levels and allows the pipes to expand freely.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

## DIMENSIONS

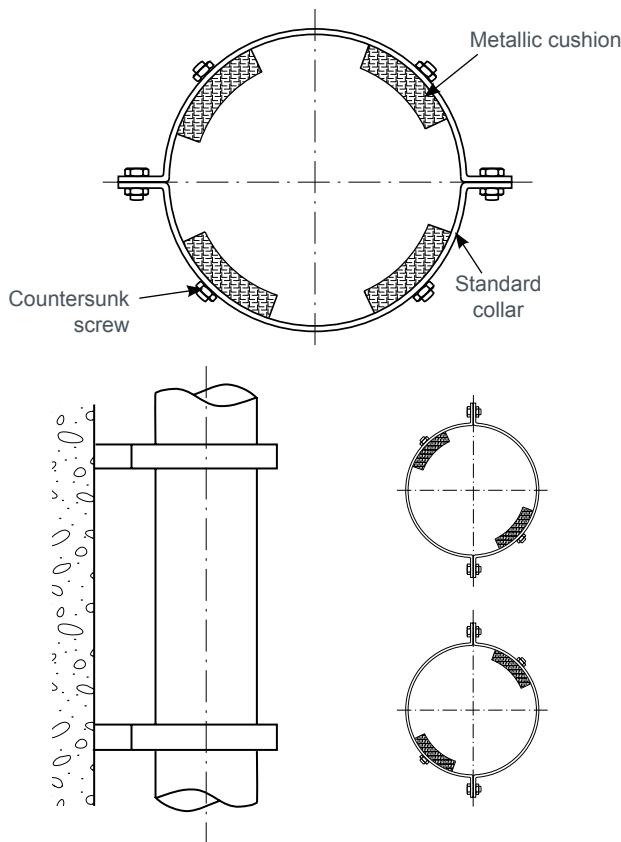

### Assembly :

Countersunk screws can be used to mount the cushions inside the collar.

The number of cushions used should be a multiple of 4, depending on the diameter of the pipework: see table below.

However, for small diameter pipes, 2 collars can be used edge to edge, each having 2 pads at opposite diagonals.

## OPERATING CHARACTERISTICS

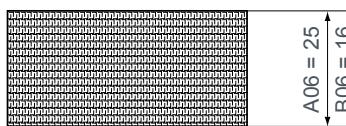

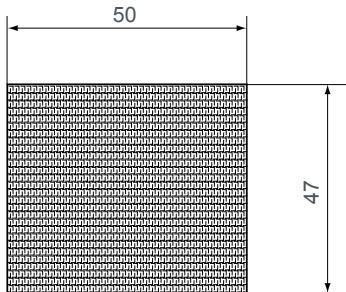

Ø of the pipe (mm)	Number of cushions
75 - 175	4
175 - 425	8
425 - 550	12
550 - 700	16
700 - 850	20
850 - 1 000	24
1 000 - 1 150	32
1 150 - 1 300	36
1 300 - 1 450	40
1 450 - 1 600	44
1 600 - 1 750	48

Max. dynamic force in compression : 800 daN.  
Static load range from 30 to 200 daN.

Collars and screws not supplied.

## DIMENSIONS

### Assembly :

Our wide range of mounts can meet many requirements. These mounts should be used as shown in the following diagram (two half collars, in which the cushions are placed side by side, are connected to the structure).

Note : the cushions may be mounted in two orientations : the height H is shown on the table. Refer to the drawing to ensure that the height H is correct when mounted.

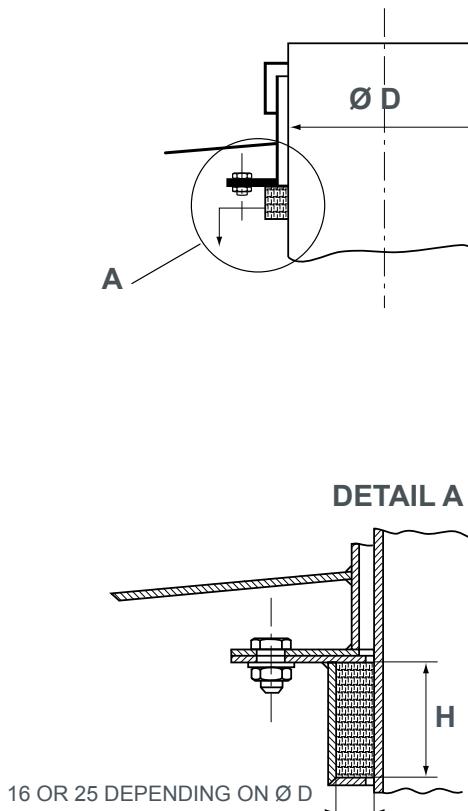

### Choice :

The cushions are 16 mm or 26 mm thick. We advise using VI700-B06 pads (16 mm thick) for  $\varnothing D$  pipes < 270 and VI700-A06 (25 mm thick) for  $\varnothing D$  pipes > 270.

For example :

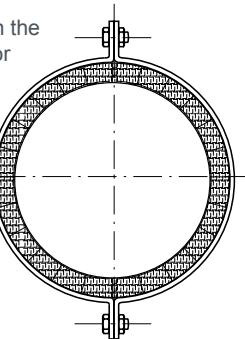

- for  $\varnothing D$  ext 140 pipe : use 9 VI700-b06 cushions;
- for  $\varnothing D$  ext 1000 pipe : use 61 VI700-A06 cushions.

## OPERATING CHARACTERISTICS

Use spacers between the half collars to allow for future tightening

Cushions VI700-A06  
(25 mm thick) or  
VI700-B06 (16 mm thick)

Necklace and screw  
not supplied.

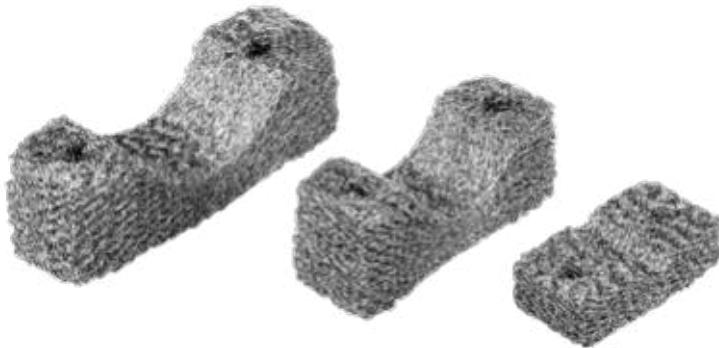

Pipe $\varnothing D$ (mm)	H (mm)	Number of cushions	Pipe $\varnothing D$ (mm)	H (mm)	Number of cushions

300 to 340	50	20	1 530 to 1 725	47	96

Maximum dynamic force in compression : VI700-A06 = 1 200 daN  
VI700-B06 = 1 600 daN

Static load range from 75 to 400 daN

# METALLIC CUSHIONS FOR PIPEWORK

Natural frequency : (1)  
depending on load

## DESCRIPTION

The metal cushions for pipework are made from stainless steel wire that is work hardened, knitted, crimped and compressed to a given shape in a press.

The cushion can be supplied on its own or in a mounting kit which comprises two cushions, two spacers, a retaining zinc plated steel clamp.

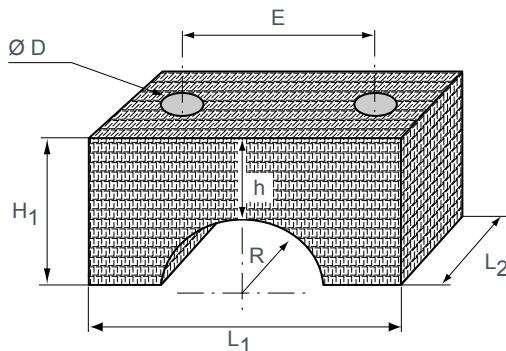

## APPLICATIONS

The cushions are resistant to temperatures from - 70°C to + 300°C and are used to clamp and isolate pipes against vibration.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# V43 V44 V45 V46

Natural frequencies :  
(1)  
V4\* = 22 to 30 Hz  
V4\*W = 15 to 22 Hz

See also PAULSTRA  
elastomer range :  
Nivofix - Minifix

## DESCRIPTION

Standard V43, V44, V45 and V46 mounts have a cast steel base and a resilient element made from a stainless steel wire cushion.

The version H includes a cup and a levelling stud. It can also be equipped with grip pads.  
Version W differs from the standard version as it has a thicker cushion for greater flexibility

## APPLICATIONS

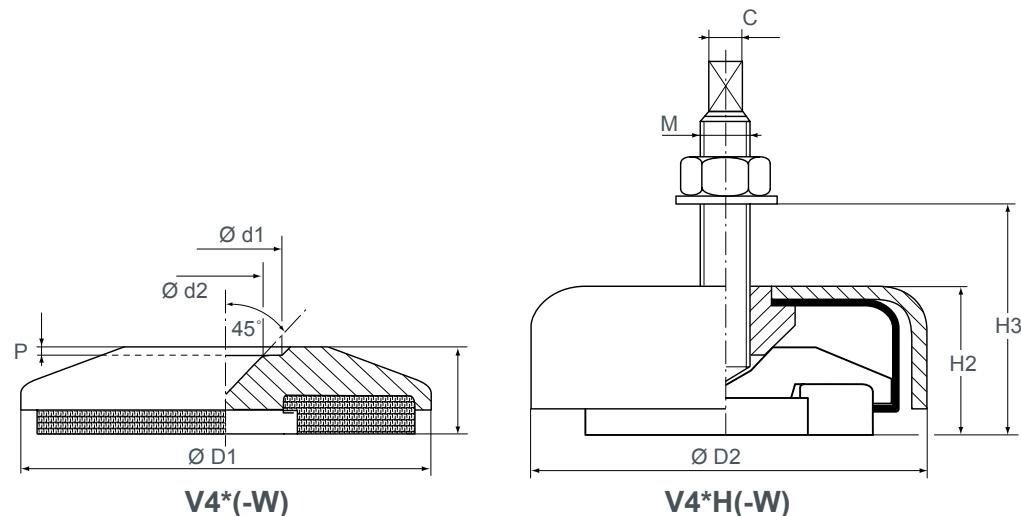

This range with a natural frequency of 15 to 30 Hz can be used for mounting machine tools in harsh industrial environments.

They are unaffected by oil, temperature and fatigue and their life time is often the same as that of the machine.

The thicker metallic cushion of the version W, can be used for mounting forming tools (presses, shears, folding machines) and improves the vibration isolation level.

# V47 V47D V47T V47Q

Natural frequency : (1)  
8 to 20 Hz

## DESCRIPTION

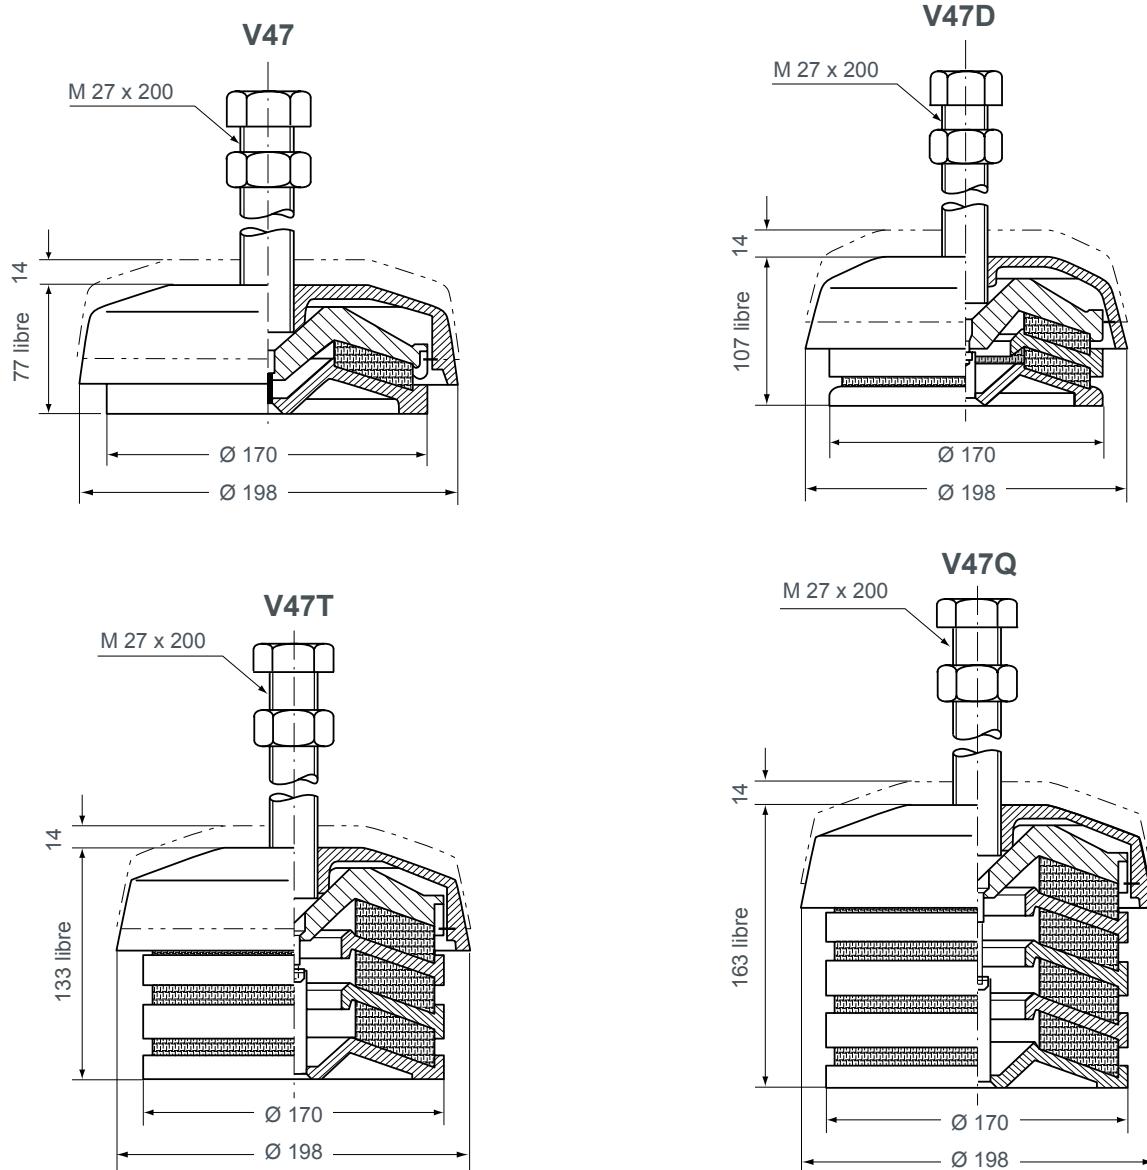

- Anti-vibration mount available with a constant natural frequency over a wide load range.
- Cast iron base and levelling device.
- Conical wire mesh cushion, capable of carrying lateral loads.
- V47D version has a stack of two cushions with a cast iron separating cup.
- V47T and V47Q have three and four metal cushions respectively.

## APPLICATIONS

This machinery mount, with adjustable height, is used for machine tools and other rotating machines. The V47 and V47D are designed for presses and printing machines.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

Low profile mounts with high static and dynamic load range.

- 100% 316 stainless steel.
- Natural frequency from 15 to 18 Hz.
- Dynamic load in compression : 3 g.
- Maximum sinusoidal input at resonance:  $\pm 0.4$  mm.

## APPLICATIONS

- Anti-vibration mounts for presses and machine tools without the need to fix or grout in position.
- For chemical, food industry,...

## OPERATING CHARACTERISTICS

# SP55\*W

# SP56\*W

Natural frequency : (1)  
15 to 20 Hz

## DESCRIPTION

Machine mount available with a stud (SP55\*W) or threaded hole (SP56\*W).

- Top cup and stud are mild steel zinc plated.
- Stainless steel wire mesh cushion.
- Natural frequency between 15 to 20 Hz.

## APPLICATIONS

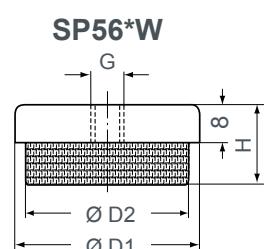

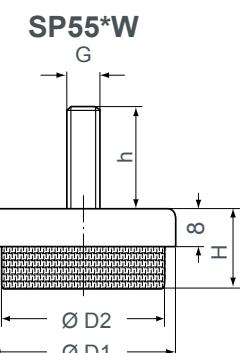

- Mount for low loads.
- Suitable for rotating machines (> 2500 rpm) and laboratory equipment ...

## OPERATING CHARACTERISTICS

# **SP539-882 SP539-883 SP539-887 SP539-888**

Natural frequency : (1)  
10 to 16 Hz

## **DESCRIPTION**

All metal mount comprising a stack of between two and three woven steel cushions giving a variation in natural frequency depending upon the number of cushions. This make higher levels of isolation possible.

The stainless steel cushions in conical shape are capable of carrying radial loads.

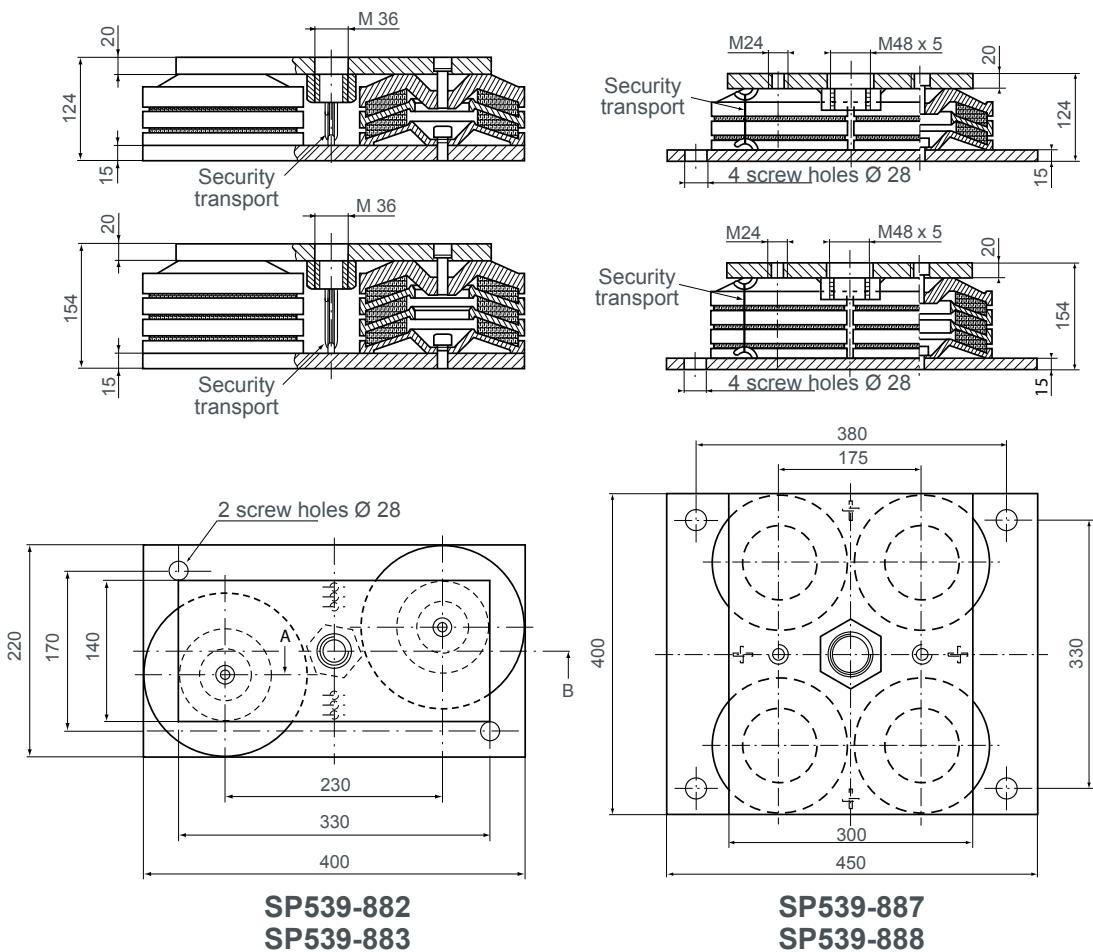

This mount ensures good stability of the suspended equipment.

## **APPLICATIONS**

- Metal cutting or metal forming machines (presses, punches, ...).
- Heavy rotating machines.n Machines tournantes fortes charges.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# V118-MG V118-DG V318 V318-D

Natural frequency : (1)  
11 to 22 Hz

## DESCRIPTION

V118-MG and V318 mounts have cast iron cover and base with 4 mountings holes in the base and a central tapped hole in the cover.

The resilient elements are stainless steel wire mesh cushions :

- V118-MG and V318 have two cushions;
- V118-DG and V318-D have three cushions.

## APPLICATIONS

This series of mounts have a natural frequency between 18 and 25 Hz and can be used for mounting :

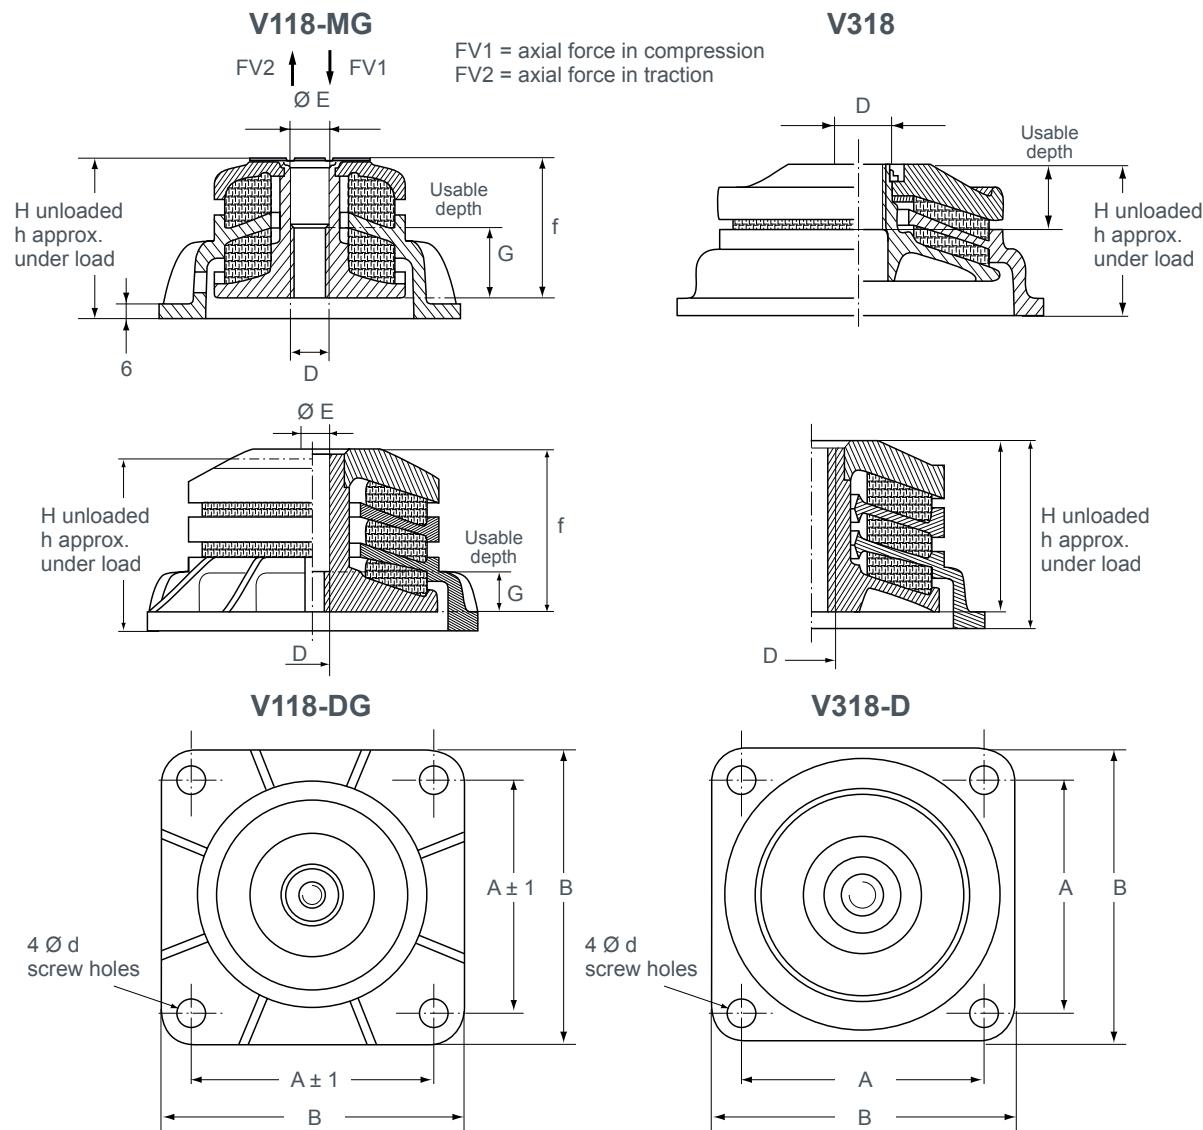

- heavy machinery (grinders, crushers, inclined presses, eccentric presses, printing presses, textile machines);
- rotating machines (motors, generator sets, pumps, etc), which rotate at more than 2000 rpm for V118-DG and V318-D and up to 2500 rpm for V118-MG and V318;
- gantry cranes (structure, cabs, equipment).

The isometric stiffness characteristics and anti-rebound metal cushions of these suspensions makes them suitable for suspending engines on ships, vehicles, etc.

As they can withstand temperatures between - 70°C and + 300°C, they can also be used for mounting exhaust pipes.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# V120 V120-D V125 V125-D

Natural frequency : (1)  
13 to 20 Hz

## DESCRIPTION

Series of all metal low profile mounts with one or two cushions, working in compression only, permitting high dynamic overloads (using a load distribution plate). Mounts can be fixed to floor.

Made of cups welded on a steel base with one or two stainless steel cushions (inox 18/8).

The steel parts are painted to protect against corrosion.

## APPLICATIONS

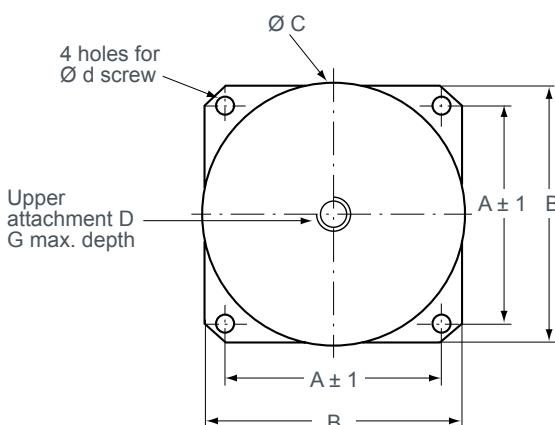

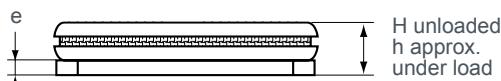

These mounts are designed for :

- suspension of presses;
- suspension of machine-tools which do not need levelling;
- suspension of transformers, diesel engines;
- suspension of rotating machines operating :
  - > 2500 rpm : V120 and V125;
  - > 2000 rpm : V120-D and V125-D.

# V164

# V168

Natural frequency : (1)  
8 to 22 Hz

## DESCRIPTION

The V164 and V168 dampers have a cover, an AG3 mounting plate and an AU4G shaft. The assembly is chromatised.

The upper and lower stainless steel cushions are the resilient elements of the mount. It has four Ø 8 mounting holes on the mounting plate and one M10 tapped hole on upper cover.

## APPLICATIONS

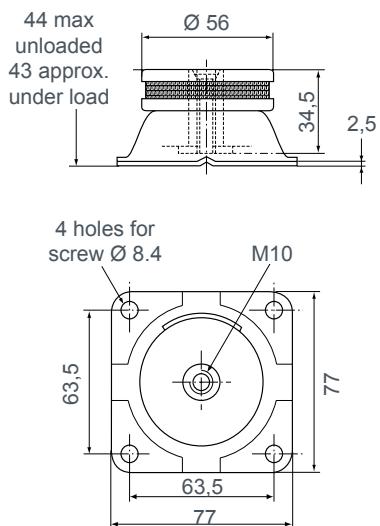

The load range of between 5 and 170 kg makes it suitable for isolating light machine tools from motors with rotational speeds of over 2500 rpm.

The V164 has an isometric natural frequency of 15 to 22 Hz and 8 to 12 Hz. Their lower cushion can withstand accidental traction forces (for example, shock rebound).

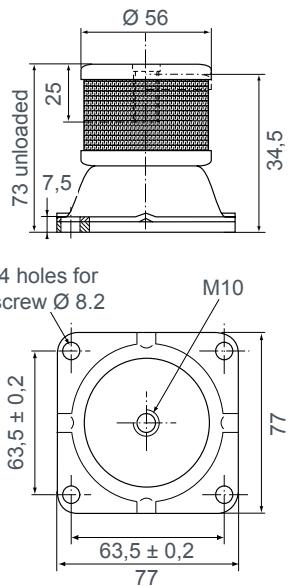

These dampers are not affected by aggressive chemicals and can be used, for example, for mounting petro-chemical pumps.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# V402 - MG

Natural frequency : (1)  
15 to 22 Hz

## DESCRIPTION

The V402-MG damper has a cast iron upper cover and mounting plate and a high strength aluminium alloy shaft.

The resilient element is a woven stainless steel cushion.

The cast iron parts are painted.

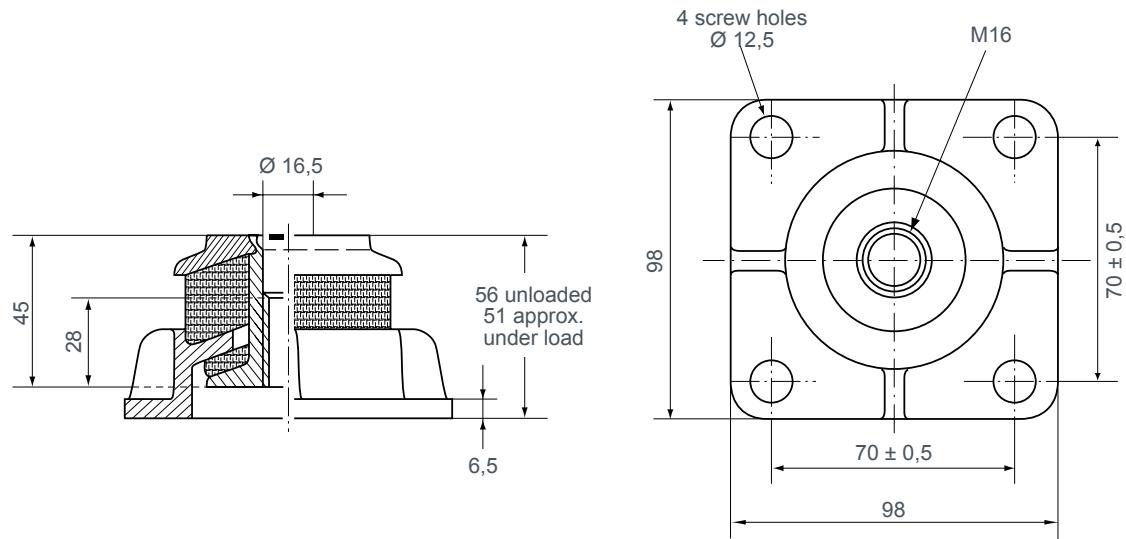

## APPLICATIONS

This all metal damper has a natural frequency between 15 and 22 Hz and is isometric within the defined load ranges. It is designed for compression loads but its retaining cushion makes it able to withstand high tensile forces.

The conical cushions provide resilience in all directions. It can be used to suspend fixed or on board machine tools and rotating machines (pumps, engines, generator sets rotating at speeds over 2500 rpm).

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# V1H751

# V1H752

Natural frequency : (1)  
15 to 25 Hz

## DESCRIPTION

The V1H751 and 752 range has a pressed steel casing and mounting plate and light alloy shaft. The resilient element is a stainless steel wire pad.

The steel parts are painted.

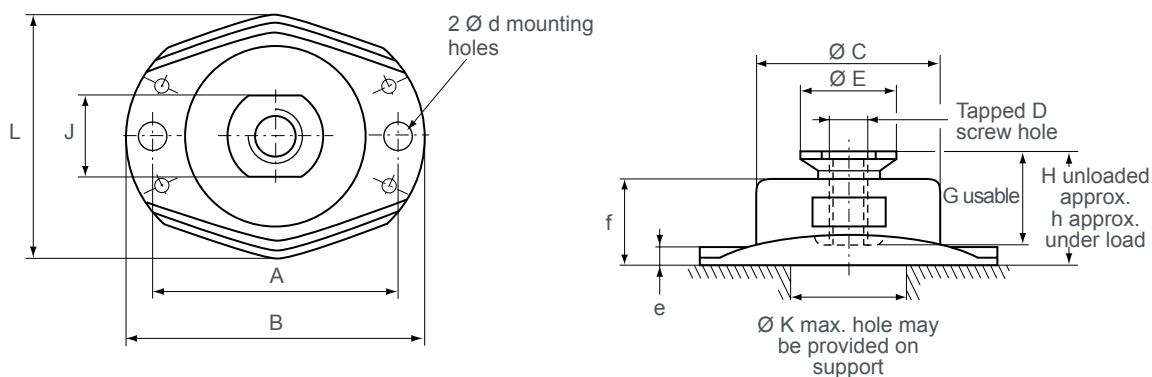

## APPLICATIONS

The V1H 751 and 752 have a natural frequency between 15 and 25 Hz for static loads under compression.

The -11 and -12 versions are reinforced by radial cushions and can absorb considerable horizontal dynamic forces, which makes it possible to use them for mounting on board equipment in ships, rail, road transport, civil engineering plant (engines, pumps, generator sets, pipework) or fixed machines that have to be floor mounted.

# V1H5023 V1H5025

Natural frequency : (1)  
15 to 25 Hz

## DESCRIPTION

The V1H5023 and V1H5025 mounts have cast iron upper housing and base. The base has four fixing holes.

The resilient elements are stainless steel wire mesh cushions. The cast iron parts are painted.

## APPLICATIONS

Isolation of machine-tools : grinding machines, crushing machines, fly-presses, printing machines, textile machinery, etc.

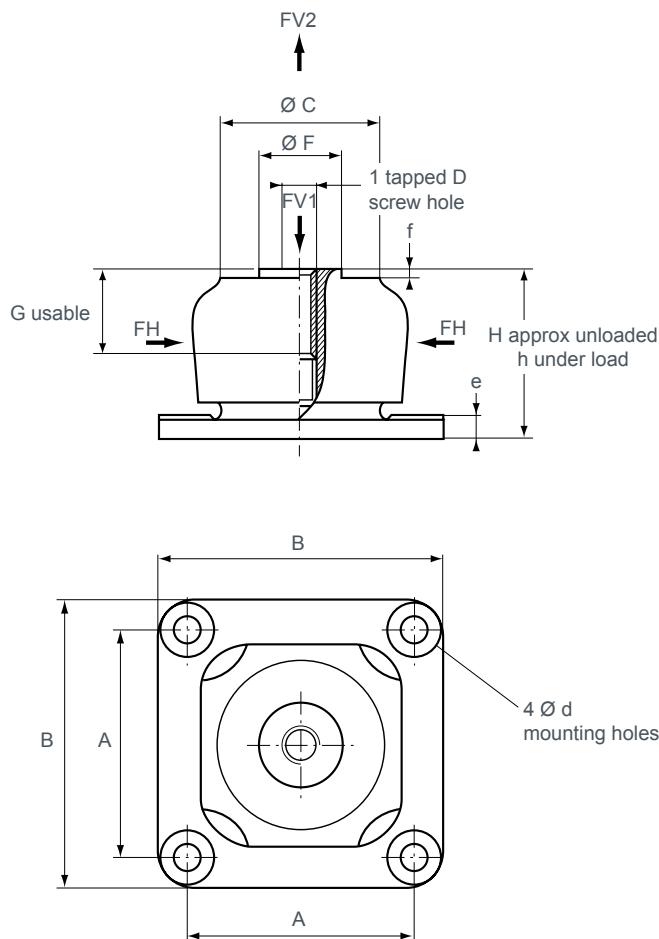

Isolation of rotating machines : engines, sets, pumps, etc. rotating over 2500 rpm.

Marine : isolation of exhaust pipes, manifold, boilers, motors, sets, pumps, etc.

# V1H-6000

# V1H-6100

Natural frequency : (1)  
12 to 18 Hz

## DESCRIPTION

The V1H-6000 and V1H-6100 steel mounts have a mounting plate, a cover and a swaged steel shaft.

They are available with stainless steel or mild steel zinc plated metalwork.

The resilient parts are stainless steel wire cushions.

The steel parts are zinc plated.

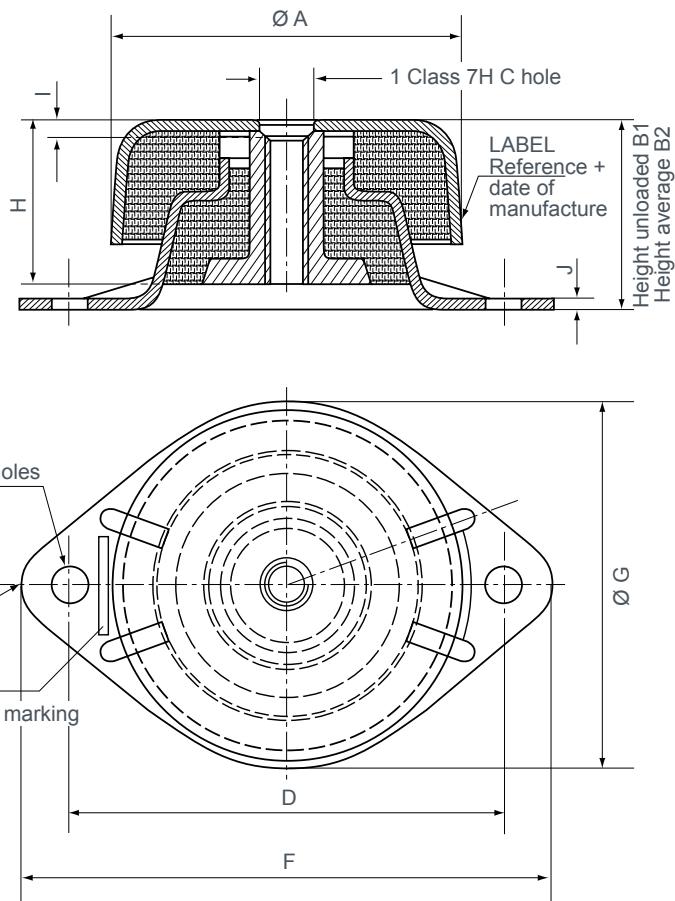

## APPLICATIONS

The V1H-6000 and V1H-6100 mounts have a natural frequency of between 12 and 18 Hz and are designed for suspending rotating machines, electronic cabinets, pipes, air conditioning systems, etc. Its all metal construction means that its characteristics do not deteriorate with time and it maintains its height under load, even in the most severe ambient conditions and temperatures.

The shape of the armature and upper cushion provide high radial performance and a structural strength of 3 g, making it suitable for mounting on board equipment on military ground vehicles and ships.

# **V1B1114 V1B1134 V1B1115 V1B1135 V1B1116 V1B1136**

Natural frequency : (1)  
3 to 9 Hz

## **DESCRIPTION**

This range of mounts has one or two steel mounting plates depending on the model, one or several high strength steel springs, 2 light alloy rings and a stainless steel wire cushion in each spring. All steel parts are painted.

## **APPLICATIONS**

These very low frequency isolators (down to 3 Hz) can be used to mount machine rotating at speeds over 450 rpm, vibrators and impact machines, achieving an attenuation of about 95%.

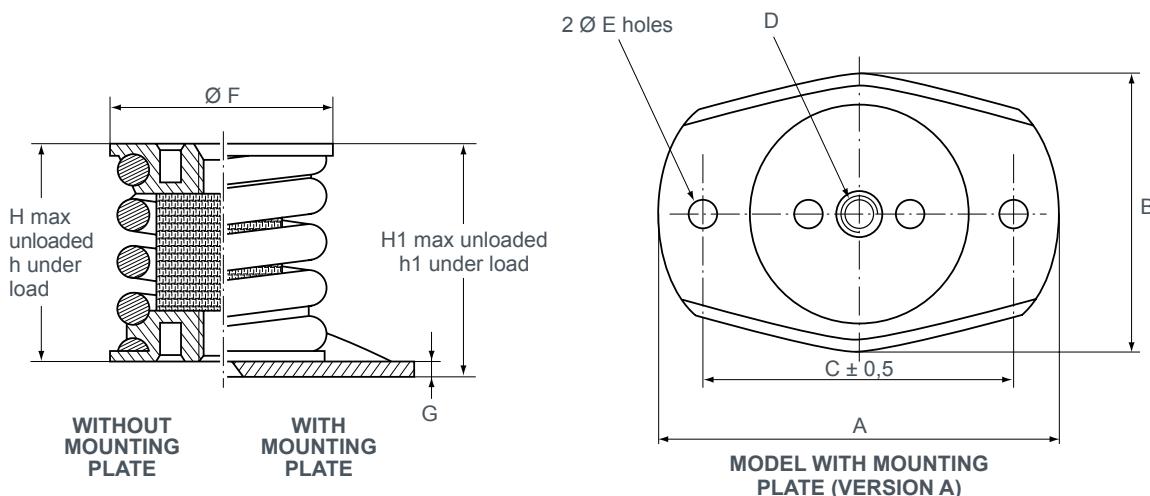

They are all metal and can be used outdoors or in the harshest conditions.

As they do not creep, their life time may be the same as that of the machine they are used to mount.

A metal cushion inside each spring increases the damping factor and limits the amplification at the natural frequency.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# 7002

Natural frequency : (1)  
• axial 7 to 10 Hz  
• radial 4,5 to 6 Hz

## DESCRIPTION

The 7002 damper has a satin finish treated AG3 casing and mounting plate, a stainless steel centre axis. A spring and stainless steel cushion provide the resilient elements. It has four Ø 5.2 mounting holes in the base and a tapped hole in the centre axis.

## APPLICATIONS

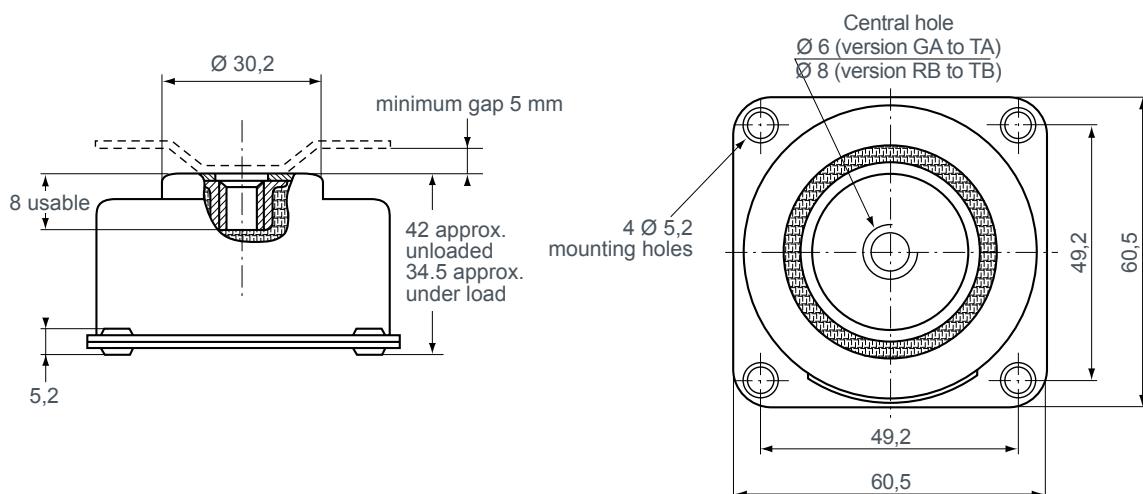

Its axial natural frequency of between 7 and 10 Hz and its integral travel limiter enable 7002 dampers to be used for mounting electronic or computer equipment, navigation equipment and on board measurement instruments.

They can also be used for static equipment for suspending control panels, etc.

Their all metal construction enable them to operate in the harshest of conditions.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

# DIMENSIONS

# OPERATING CHARACTERISTICS

- Natural frequency :
  - axial : 7 to 10 Hz depending on load;
  - radial : 4.5 to 6 Hz depending on load.
- Maximum permitted excitation at natural frequency of suspension :  $\pm 0.75$  mm.
- Amplifier factor at resonance : < 4.
- Operating temperature : - 70°C to + 300°C.
- Structural strength corresponds to continuous acceleration of 10 g with maximum load.
- Travel available under shock :
  - axial :  $\pm 6$  mm;
  - radial :  $\pm 5$  mm.
- Weight : 100 to 200 (depending on version).

# MV70 MV71 MV72 MV73

Natural frequency :  
axial and radial 15 to 25 Hz (1)

## DESCRIPTION

All metal mount design to carry load in compression or tension and which includes an internal limit stop.

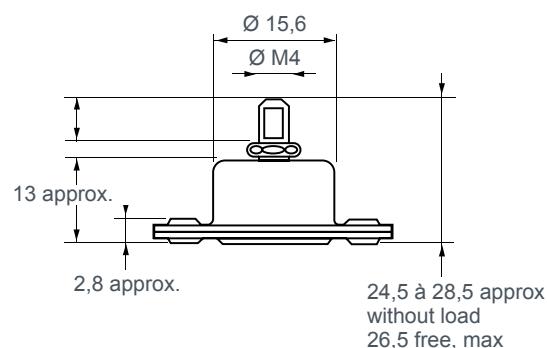

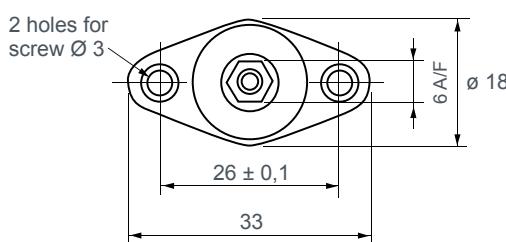

## APPLICATIONS

Protection of components, assemblies and electronic equipment mounted in aircraft, road vehicles and trains including navigation equipment, control consoles, measuring instruments.

## TECHNICAL CHARACTERISTICS

- Max permitted excitation at natural frequency :
  - MV70 :  $\pm 0,3$  mm.
  - MV71 :  $\pm 0,4$  mm.
  - MV72 :  $\pm 0,45$  mm.
  - MV73 :  $\pm 0,45$  mm.
- Amplification factor at resonance : < 4.
- Operating temperature : - 70 °C to + 300 °C.
- Structural strength corresponds to continuous acceleration of 10g with maximum load
- Internal snubber design for equivalent performance during continuous acceleration at maximum load.

# VE101 VE111 VE112 VE113

Natural frequency : (1)  
3,5 to 6 Hz

See also  
**PAULSTRA**  
elastomer range :  
Traxiflex

## DESCRIPTION

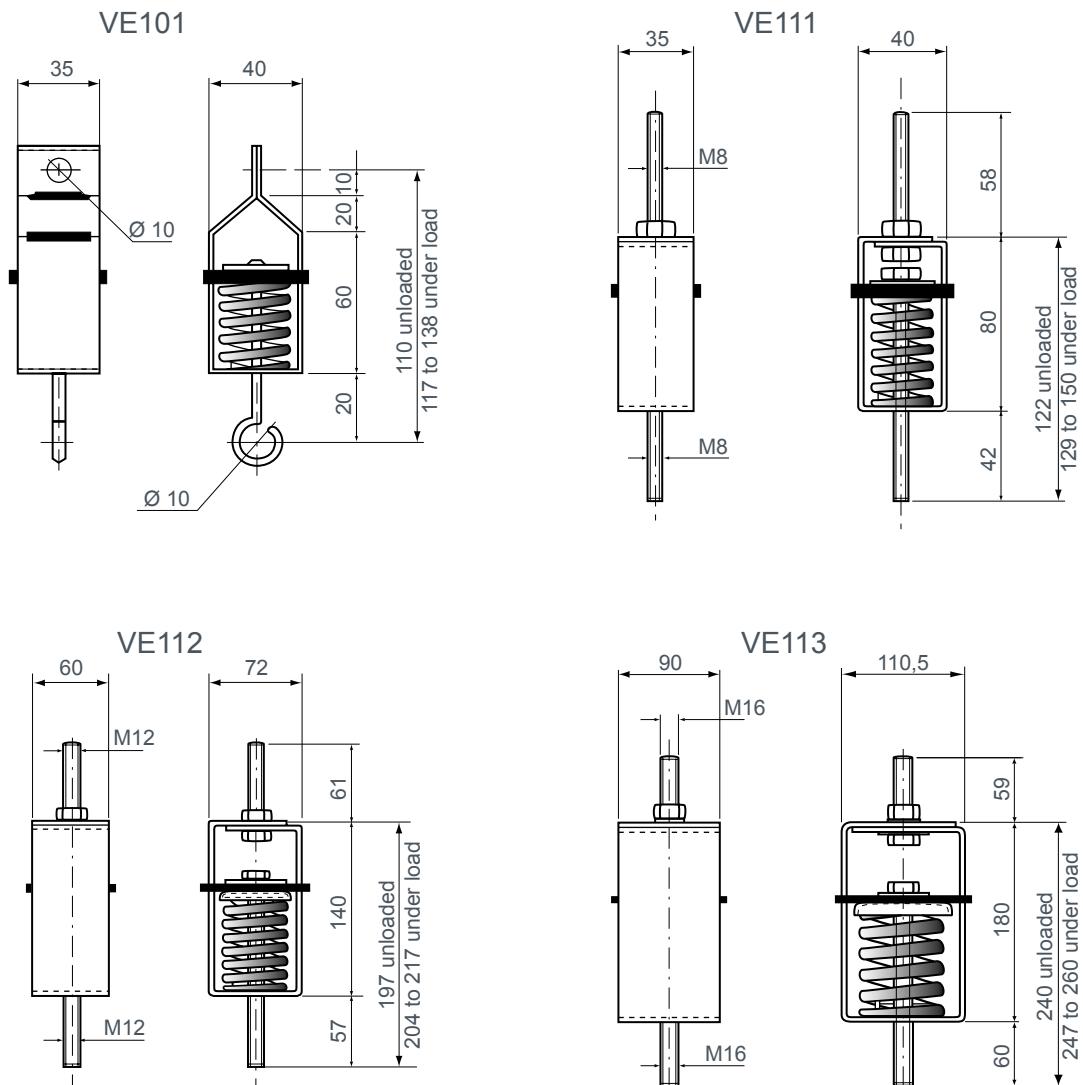

VE isolators have a cylindrical stainless steel spring, a galvanised body, an elastomer noise reduction guide and steel rings or studs depending on the model.  
The VE112 series has a steel cushion inside the spring.

## APPLICATIONS

These isolators with a natural frequency of between 3.5 and 6 Hz are specially designed for suspending false ceilings, air conditioning equipment and pipework and significantly reduces noise in buildings.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

## Vibration characteristics

- Natural frequency: 3.5 to 6 Hz.

# VIBCABLE

Natural frequency : (1)  
5 to 25 Hz

## DESCRIPTION

This range of mounts has a stainless steel cable wound between light alloy bars. The 8010 to 8060 versions are assembled using stainless steel clips and the 8080 to 8140 models have galvanised steel screws.

There are two or four mounting holes, per bar, smooth, counter sunk or tapped.

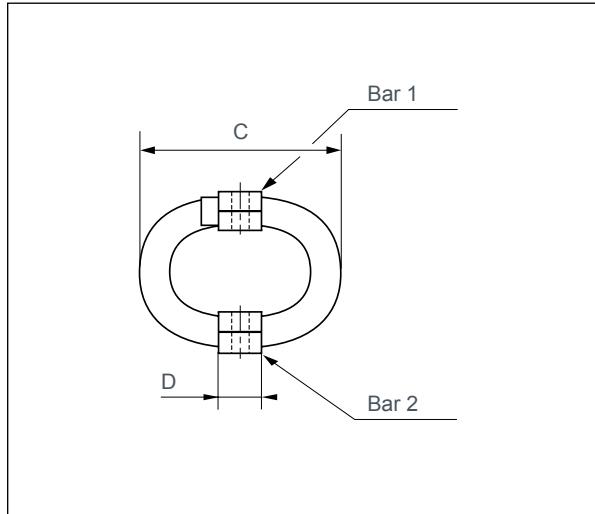

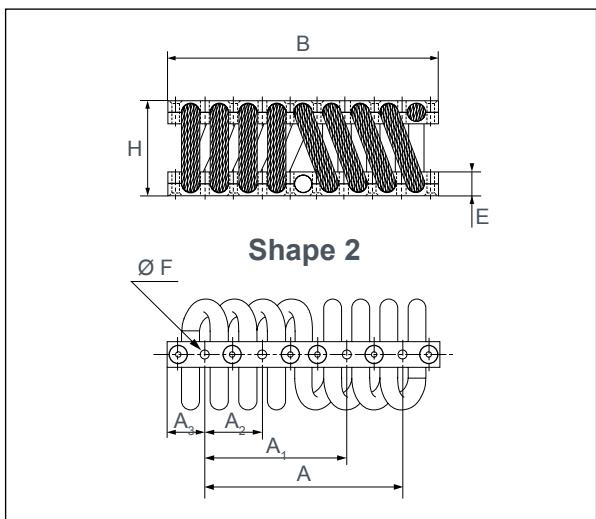

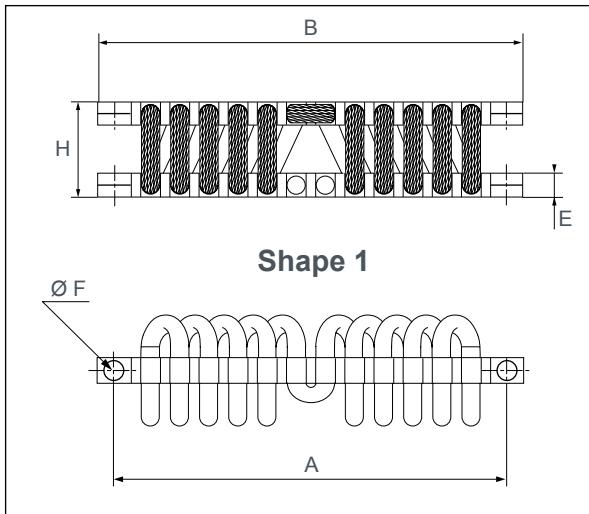

## APPLICATIONS

With a natural frequency between 5 and 25 Hz, damping up to 40% and high deflection in all directions, these dampers can absorb accelerations to equipment subjected to shock or drop.

Protection of equipment in containers, protection of racks and any fragile on board equipment.

(1) Natural frequencies with max/min loads, see : OPERATING CHARACTERISTICS.

- Operating temperature**  
- 180 °C to + 300 °C.
- Electrical resistance**  
with conducting coating < 210° Ω.
- Environment**  
The material used are unaffected by harsh environments.
- Vibration transmission coefficient curves**  
For perfectly free system.

The bars can be supplied with smooth, threaded or countersunk holes. Several combinations are possible :

Bar 2	Bar 1			
	Smooth holes : L	Threaded holes : N	Countersunk holes : F	
	Smooth holes : L	LL	NL	FL
	Threaded holes: N	LN	NN	FN
	Countersunk holes : F	LF	NF	FF

- Codification example : V3CA8010-01 LL**

# OTHER METAL SUSPENSIONS MV801 MV803

## DESCRIPTION

MV801 and MV803 has a stainless steel wire mesh cushion and spring attached to alumini-um alloy upper and lower cup with threaded centre holes.

## APPLICATIONS

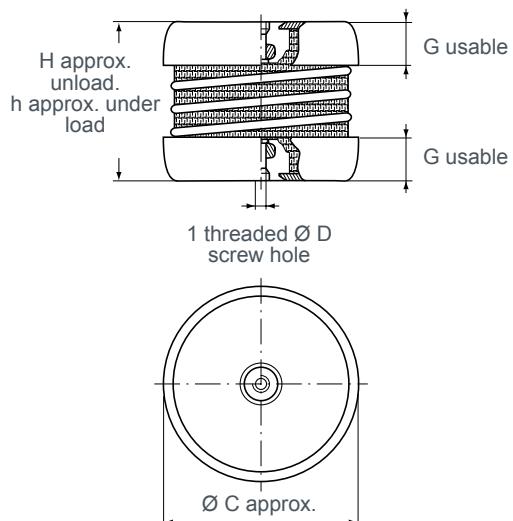

Isolation of low speed stationary rotating machines (fans, electric motors, pumps ...) sensitive equipments (measuring instruments, laboratory equipment ...).

## DESCRIPTION

A single acting telescopic anti-vibration manufactured with a helicoil spring and stainless steel woven cushion.  
Protection, paint.

## APPLICATIONS

Isolation of exhaust studding and pipework.

## OPERATING CHARACTERISTICS

- Maximum permitted excitation at natural frequency of suspension :  $\pm 1$  mm.
- Natural frequency for this amplitude :
  - axial : 3.5 to 5 Hz depending on load.
- Structural strength corresponds to continuous acceleration of 3 g with maximum load.
- Operating temperature : - 70°C to + 150°C.
- Displacement in all directions :  $\pm 40$  mm.
- Adjustment between attachment points :  $\pm 20$  mm.

## DESCRIPTION

Part of a series of very low frequency isolators working in compression only, giving very efficient isolation for rotating machines running at 250 rpm and above.

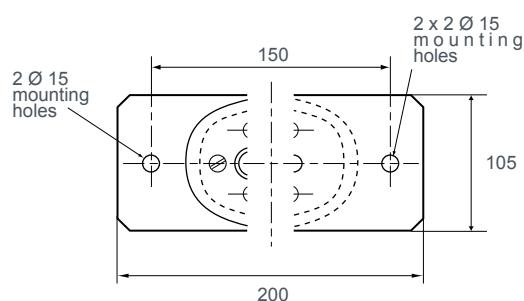

## APPLICATIONS

Rotating machinery, hoppers and sensitive equipment with or without the use of inertia blocks.

## OPERATING CHARACTERISTICS

- Maximum permitted excitation at natural frequency of suspension :  $\pm 3$  mm.
- Natural frequencies for this amplitude :
  - axial : 1,8 to 2,2 Hz depending on load
  - radial : 3 to 3,5 Hz depending on load
- Amplification factor at resonance : < 5.
- Structural strength corresponds to continuous acceleration of 2 g with maximum load.
- Operating temperature : - 70°C to + 300° C.

# V1210

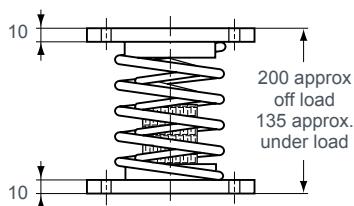

## DESCRIPTION

Part of a series of very low frequency isolators working in compression only, giving very efficient isolation for rotating machines running at 250 rpm and above.

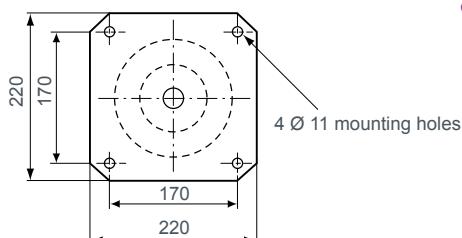

## APPLICATIONS

Rotating machinery, hoppers and sensitive equipment with or without the use of inertia blocks.

## OPERATING CHARACTERISTICS

- Maximum permitted excitation at natural frequency of suspension :  $\pm 3$  mm.
- Natural frequency for this amplitude :
  - axial : 1,8 to 2,2 Hz depending on load
  - radial : 3 to 3,5 Hz depending on load
- Amplification factor at resonance : < 5.
- Structural strength corresponds to continuous acceleration of 2 g with maximum load.
- Operating temperature : - 70°C to + 300°C.

Reference	Static axial load (daN)
V1210-51	460 - 740

## DESCRIPTION

The assembly comprises :

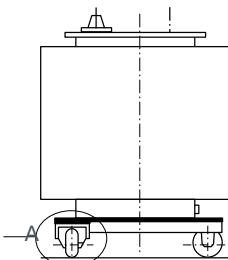

- two metal cushions.
- a nut.
- two Belleville washers.
- a threaded centre axis.
- two flat washers.

## APPLICATIONS

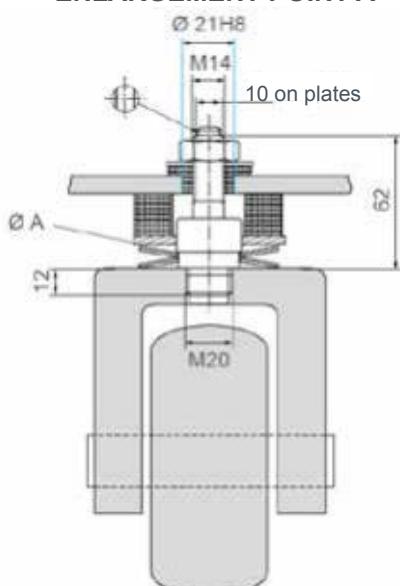

Mountings for transformers with a locking system for use in transit.

## OPERATING CHARACTERISTICS

- Natural frequency :
  - axial
  - radial } 10 to 15 Hz depending on load.
- Attenuation 100 Hz > 90%.
- Good resistance to oil.
- Electrically conductive.

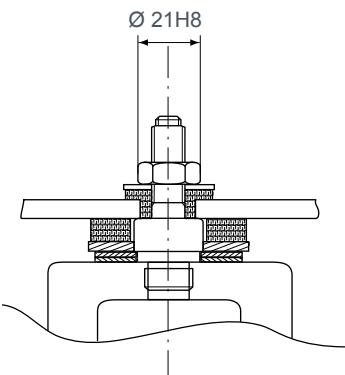

**ENLARGEMENT POINT A**

# VIBRAFLOT® 357-961

## DESCRIPTION

VIBRAFLOT® is an antivibration system consisting of the following elements :

- metallic box containing a low frequency spring;
- elastomer sheet to isolate high frequencies;
- system to fit the floating floor and set its height.

## APPLICATIONS

Typical applications for floating floor in buildings :

- Theatres
- Ground floor shops
- Concert theatres
- Hospital
- Laboratories
- Sports & dance halls
- Cinemas
- Thalasso, Spas
- Discotechs
- Technical areas
- Hotels
- Auditoriums, Conference halls
- Recording studios
- Railway lines
- Luxury appartments
- Alleys

## ADVANTAGES

Low natural frequency.

- High level of vibration attenuation.
- Improved stability of the suspension and reduced vibration amplitude.
- Improved operational life for suspended machinery.
- Integrated system controlling the height of the floor.
- Mounts are accessible if modifications are required.

## FUNCTION

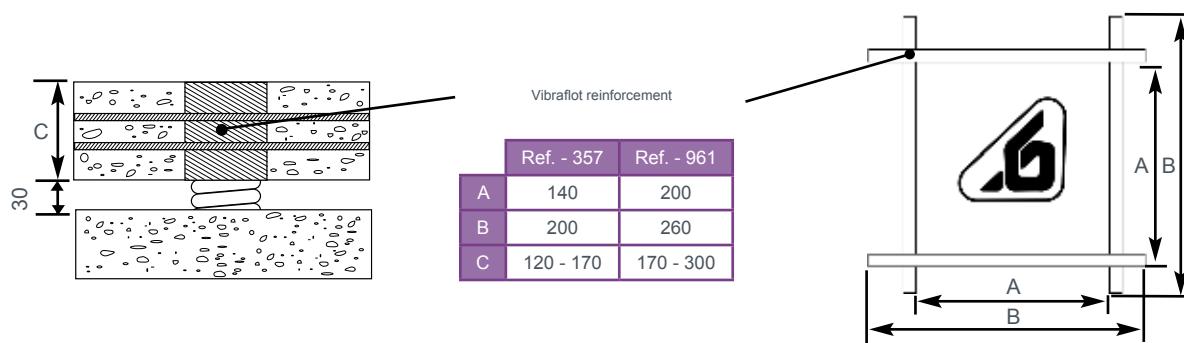

Low natural frequency.

- High level of vibration attenuation.
- Improved stability of the suspension and reduced vibration amplitude.
- Improved operational life for suspended machinery.
- Integrated system controlling the height of the floor.
- Mounts are accessible if modifications are required.

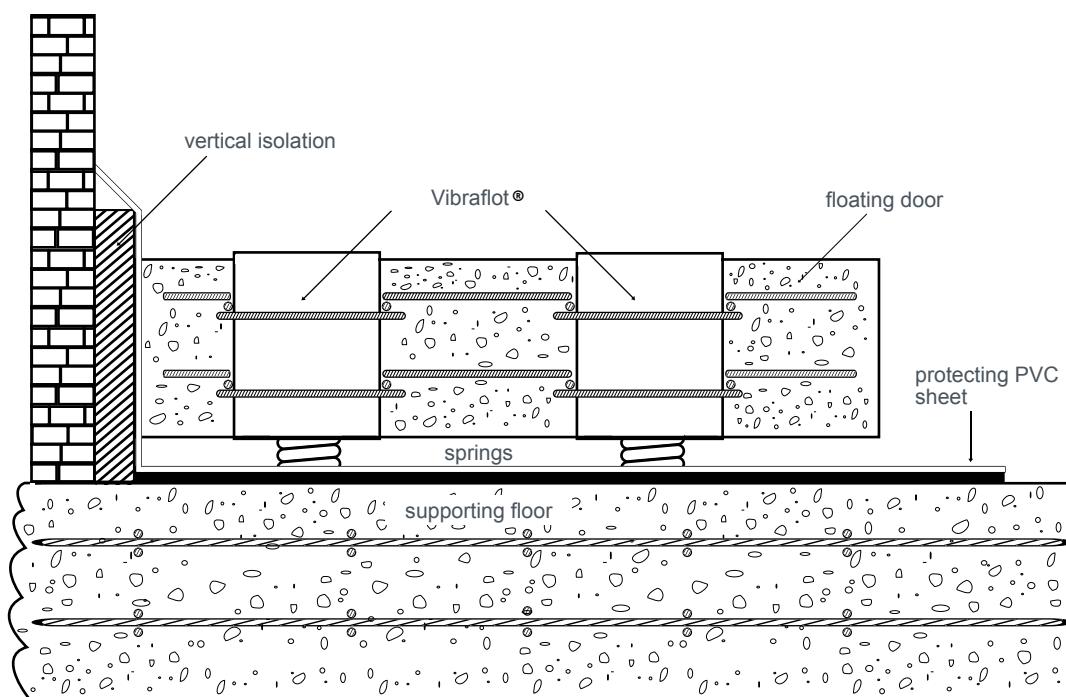

## TECHNICAL CHARACTERISTICS

Static load	From 300 daN to 2.000 daN by box
Natural frequency	3 to 6 Hz
Elastic limit	2 - 4 g in vertical 1,2 g in horizontal
Concrete thickness	From 120 to 300 mm

# DIMENSIONS

# TYPICAL MOUNTING ARRANGEMENT

# 1 - GENERAL

## 1.1 - The operation of a flexible bush

A flexible bush has an elastomeric element enclosed between an outer sleeve and a centre axis intended to replace a greased bush.

The improvements achieved in industry due to the use of elastic bushes have been justly compared to the progress achieved in the past by the use of ball joints. In fact, the improvements achieved by the latter by reducing friction and play considerably and reducing wear and noise, have been taken even further by elastomeric rubber bushes which eliminate play completely and isolate high frequency vibrations.

# 1.2 - Static characteristics

## 1.2.1 - Radial characteristics

The application of a radial force  $F_R$  causes an elastic eccentricity  $X$  by compression of the elastomer on one side and stretching of the other side.

The bush is characterised by the permissible radial static force and by the corresponding eccentricity.

In practice, the permissible radial static forces are estimated by taking the stress rate on the surface area  $S$  of the rectangle which represents the projection of part of the elastomer which is in contact with the internal tube.

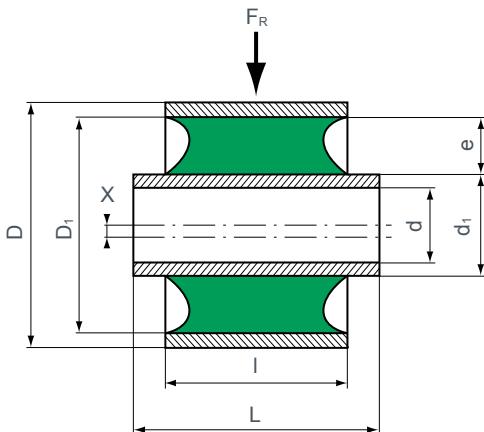

$$\text{Stress rate } t = \frac{F_R}{S} = \frac{F_R}{d_1 \times l} \quad F_R \text{ in N}$$

$d_1$  and  $l$  in m  
 $t$  in  $\text{N/m}^2$

The permissible stress is a function  $\frac{l}{D}$  of the bush and of the specific properties of the elastomer.

It is clear that the permissible deformation for a given radial force will be linked in practice to the thickness of the elastomer.

$$e = \frac{D_1 - d_1}{2}$$

## 1.2.2 - Torsional characteristics

The application of a torque to the centre axis of revolution of a bush causes an angular displacement. This displacement produces a torsional reaction expressed in N.m.

The bush is characterised by its maximum torsion angle  $\alpha$  and by the corresponding compensating torque.

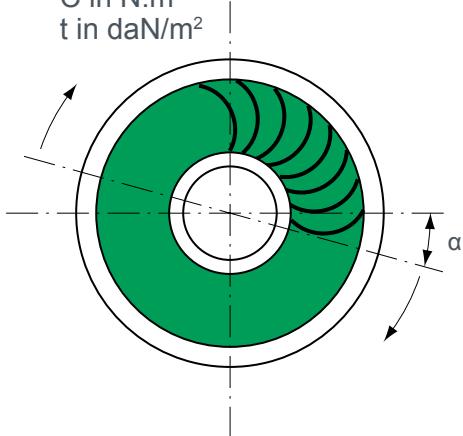

In practice, the permissible torsion angles are of the order of  $20^\circ$  to  $30^\circ$ . The maximum permissible static torque can be calculated on the basis of the stress rate at the point of contact between the internal tube and the elastomer.

$$C = t \times \pi \frac{d_1^2 / l}{2}$$

ou

$$C = \pi \frac{F_R d_1}{2}$$

$d_1$  and  $l$  in m  
 $C$  in N.m  
 $t$  in  $\text{daN/m}^2$

### 1.2.3 - Axial characteristics

When the external tube is fixed, the application of an axial force  $F_a$  on the internal tube will cause an elastic displacement "y" parallel to the axis of the bush, by shearing of the elastomer.

The bush is characterised by the permissible axial load and by the corresponding elastic displacement.

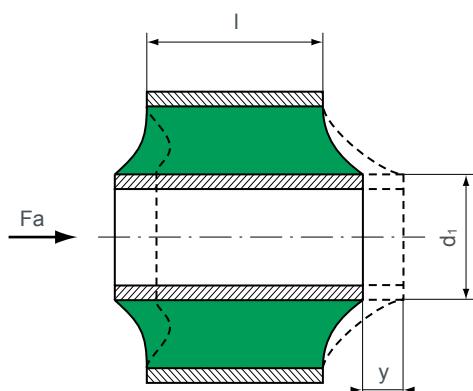

In practice, the permissible static axial loads are estimated by taking the stress rate at the internal tube.

$$F_a = \pi \times d_1 \times l \times t \text{ where } d_1 \text{ and } l \text{ are in cm and } F_a \text{ in daN and } t \text{ is in daN/cm}^2$$

The permissible static deflection is a function of the radial thickness of the elastomer.

$$y = k \cdot \frac{D_1 - d_1}{2}$$

The axial breaking load of a bonded part is of the order of 10 times the permissible static load.

### Note :

A prestressed bush which is not fully bonded must not be subjected to a static axial load.

### 1.2.4 - Conical characteristics

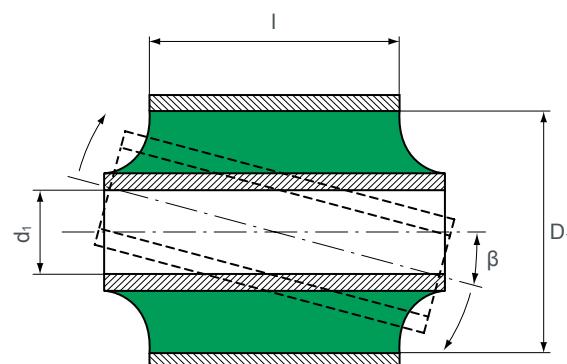

The application of a torque whose axis is perpendicular to the axis of rotation of the bush will cause an angular deformation  $\beta$ .

This deformation will in turn produce a compensating elastic torque expressed in N.m.

The bush is characterised by the permissible conical angle and by the corresponding compensating torque.

In practice, the permissible conical angles are of the order of a few degrees. They vary greatly with the slenderness ratio  $\frac{l}{D}$  of the part.

$$\frac{l}{D}$$

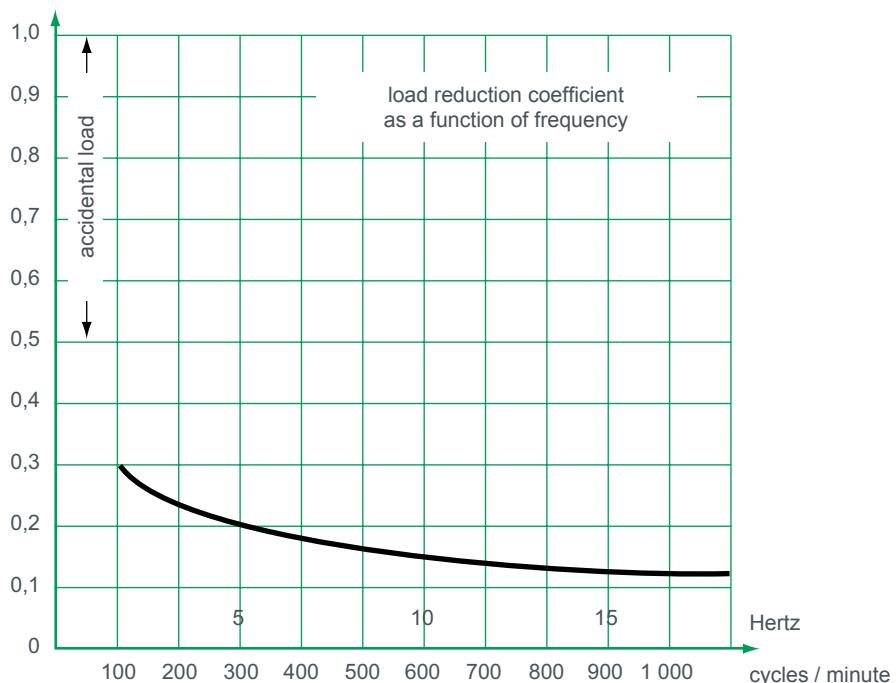

# 1.3 - DYNAMIC CHARACTERISTICS

## 1.3.1 - Dynamic loads

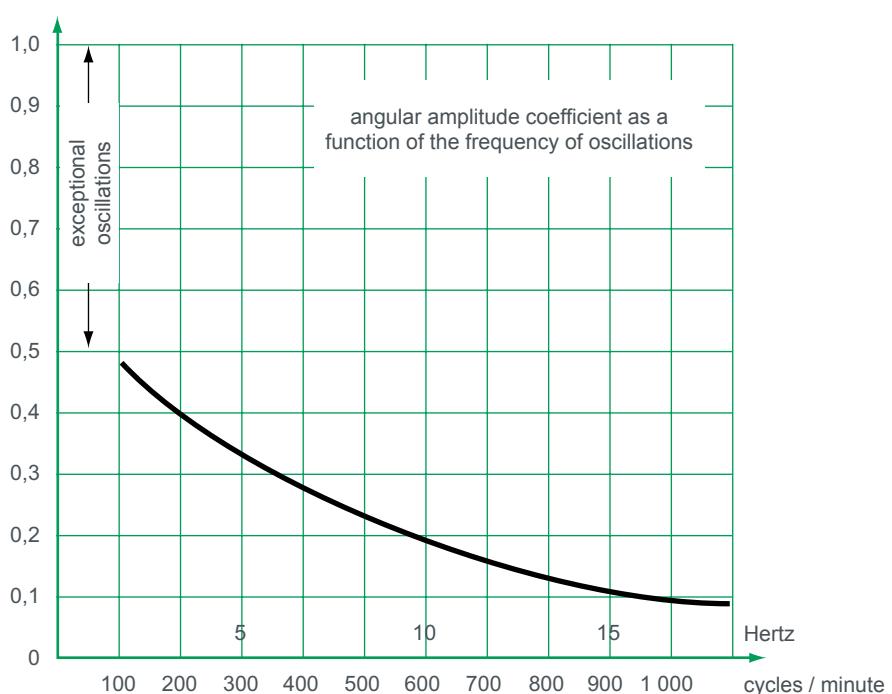

For dynamic loads, the following corrections must be added to the static loads provided in the catalogue :

- for infrequent forces of very short duration (shocks), the loads can be doubled;
- in the case of continuing periodic forces, the loads must be multiplied by a reduction coefficient  $\lambda$  which is a function of the frequency of the forces.

## 1.3.2 - Torsional amplitudes

The torsion amplitudes provided in the catalogue must be multiplied by a reduction coefficient  $\mu$  which is a function of the frequency of the oscillations.

## 2 - PRINCIPAL TYPES OF FLEXIBLE BUSHES

### 2.1 - Simple bushes

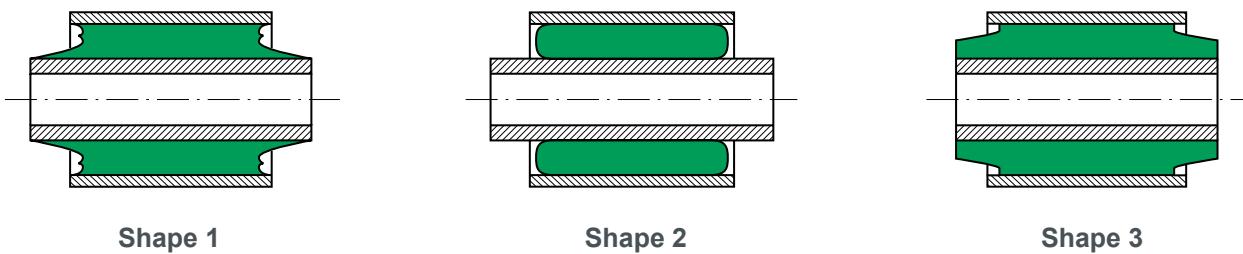

#### FLEXIBLOC (fig. 1) - FULLY BONDED

This is a bush made up of 2 concentric tubes between which of elastomer is bonded. Under the effect of external forces or torques, the relative movement of the tubes will cause an elastic deformation of the elastomer. By consulting the service conditions, a bush should be chosen which will remain within its elastic operational limits.

#### SILENTBLOC (fig. 2) - PRESTRESSED

This is a bush made up of 2 concentric tubes between which a ring of "adhérite®" elastomer is inserted by force. Under the effect of external forces or torques, the relative movement of the tubes will cause an elastic deformation of the elastomer. Above a certain value the adherite will slide in the tubes.

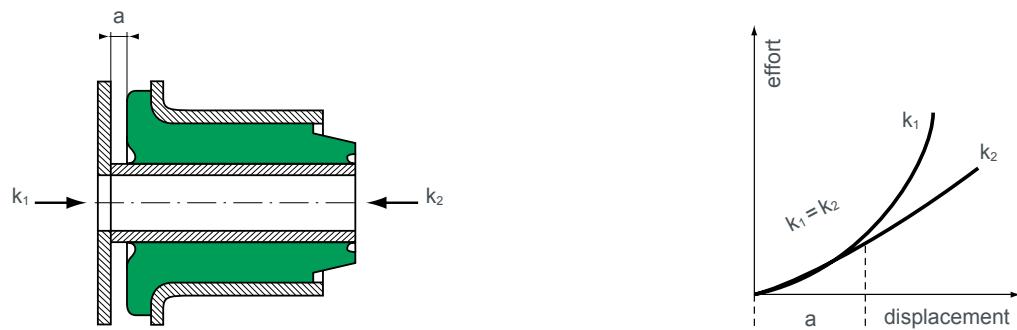

These simple bushes are considered to have lateral stops (shape. 3) when the elastomer protrudes from the external tube in the form of a support surface with various profiles.

The lateral stop only comes into operation when the bush is forced off centre by a radial load. This causes the stop to protrude, thus ensuring an "anti-noise" role at the limit of axial movement.

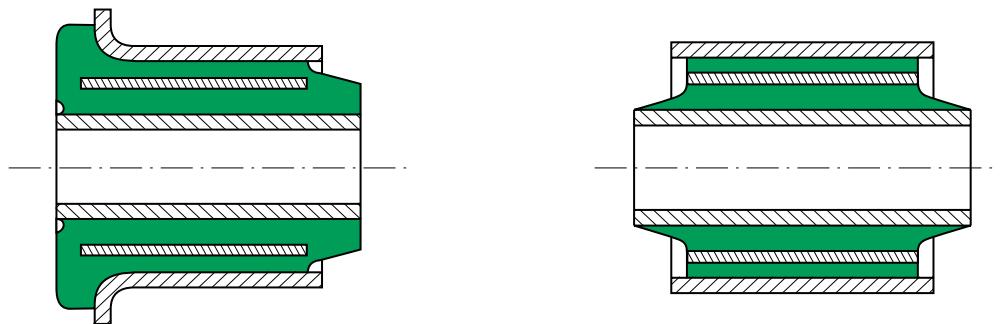

### 2.2 - Flanged bushes

In this type of bush, one of the tubes is flanged.

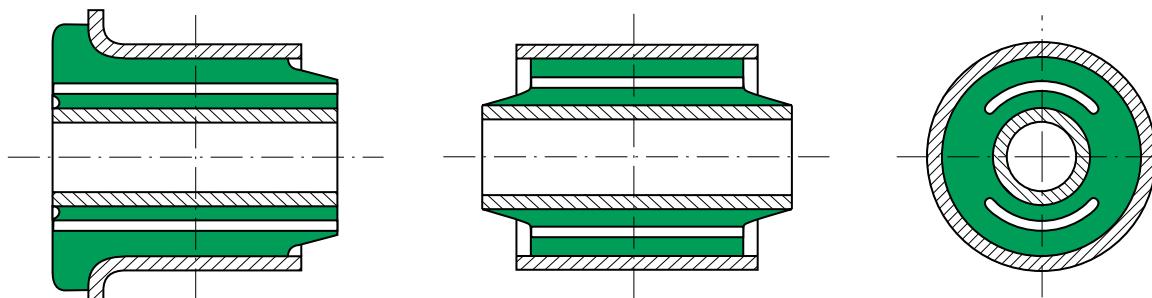

The rigidity  $k_1$  is equal to  $k_2$  if the travel is less than "a", and it becomes greater than  $k_2$  when the travel is greater than "a".

## 2.3 - Laminated bushes

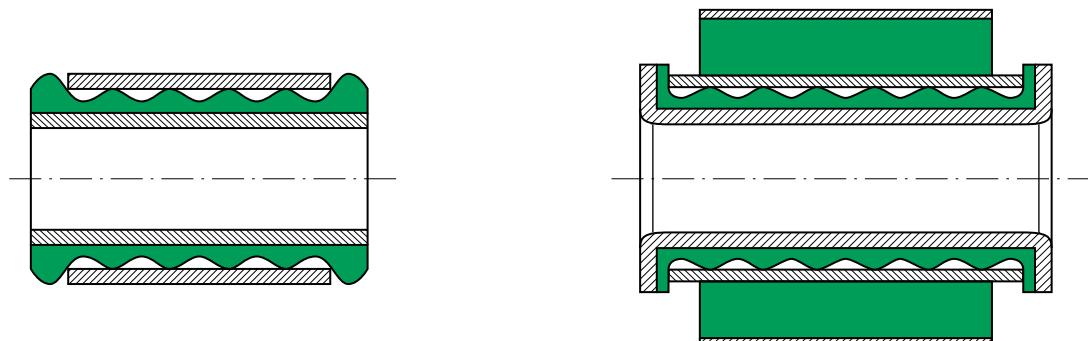

This type of bush has a thin metallic tube between the internal tube and the external tube. The object is to have a higher stiffness radially while keeping practically the same stiffness in torsion. The lamination of a bush also helps to decrease the work rate of the elastomer under high radial loads.

## 2.4 - Void bushes

A void bush is designed to have radial stiffness which are very different at  $90^\circ$  to each other. The difference in rigidity is governed by the size of the voids, which may or may not run the whole length of the bush.

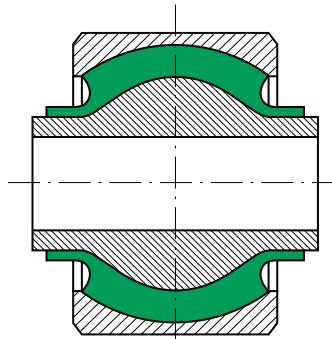

## 2.5 - Pivot bushes

### FLUIDBLOC :

This type of bush is intended to offer minimum resistance to torsion. The elastomer is bonded to only one of the armatures, and a suitable permanent lubricant ensures the lubrication between the elastomer and the second armature ensures a very low torsional resistance. Seals are provided at each end to prevent the lubricant from coming out and stop impurities from getting in. Resistance to axial force is provided by a flange in the elastomer which bears against the side of the outer sleeve, the force being transmitted by a lateral washer.

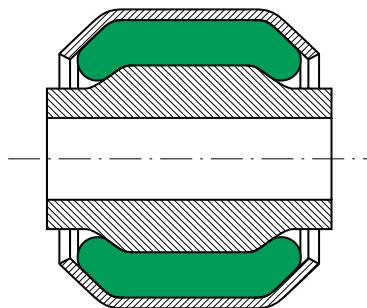

## 2.6 - Spherical bushes

### SPHERIFLEX :

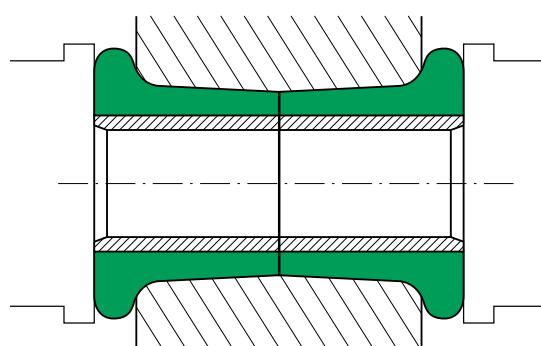

In this bush, the outer sleeve and centre axis are spherical, which enables the bush to resist relatively high radial and axial loads and to obtain a circular rigidity which is independent of the axis of rotation.

## 2.7 - Other bushes

### "SILENTBLOC®" with turned down sides :

For the same dimensions, this type of bush provides a radial load capacity which is superior to that of the classic "silentbloc®". In addition, versions of relatively short length permit conical movement more easily (reduced torque and increased angle).

### CONICAL BUSH :

This takes the form of a rubber sleeve whose external surface is a truncated, and which surrounds a cylindrical internal part to which it adheres strongly by high radial expansion.

Assembly in pair, in a housing made up of two truncated cones placed small end to small end.

By axial pressure, a high compression is created which ensures the external adherence of the rubber and causes lateral cushions to form at each end of the housing. These cushions ensure resistance to axial forces.

# 3 - OUTER SLEEVE AND CENTRE AXIS

## 3.1 - Materials used

In general, the outer sleeve and centre axis of flexible bushes are made of :

- Mild steel or polyamide for the external outer sleeve.
- Medium carbon steel for the centre axis.

The reason for the difference has to do with the method of fixation onto the internal armature, which is usually done by forcing from one end. The armature must therefore be both strong and not too thin, to avoid buckling.

## 3.2 - Protection during storage

To avoid corrosion of the steel parts, the parts are protected by a layer of phosphate which gives them a grey appearance, the whole being protected by a layer of oil.

To ease removal of fixing bolts, the internal tubes are also protected on the interior by a layer of phosphate. This protection is good for storage, but it does not constitute a "tropicalised" protection, nor is it intended to resist saline mist.

## 3.3 - Length tolerances

- Length L (internal tube) :  $\pm 0.1\text{mm}$
- Length l (external tube) : JS 15, according to NF E02 100-1 and NF E02 100-2
- Longitudinal overhang :  $\frac{L - l}{2} \pm 0.4\text{ mm}$

## 3.4 - Diameter tolerances

On the internal diameter d : H10

d (mm)	3 to 6	6 to 10	10 to 18	18 to 30	30 to 50
H10	+ 0,048 + 0	+ 0,058 + 0	+ 0,070 + 0	+ 0,084 + 0	+ 0,1 + 0

On the external diameter D :

D $\leq$ 25 (mm)	25 < D $\leq$ 40 (mm)	D > 40 (mm)
+ 0,05 + 0	+ 0,1 + 0	+ 0,15 + 0

Recommended tolerance for fitting into a bored hole : boring D : N9 :

D (mm)	10 to 18	18 to 30	30 to 50	50 to 80	80 to 120
N9	- 0 - 0,043	- 0 - 0,052	- 0 - 0,062	- 0 - 0,074	- 0 - 0,087

## 4 - THE SELECTION OF A FLEXIBLE BUSH

In order to specify a bush correctly for a given application, the following criteria must be determined :

### Basic data

For each of the 4 characteristics of the part (axial, radial, torsion or conical), the following values must be taken into account :

- the maximum static values (of force and/or of deflection) to which the part is subjected;
- the maximum dynamic values and their frequencies.

### Fundamental parameters

Depending on the application, determine from the basic data the major fundamental parameter(s) which govern the choice of the bush to be used.

### Dimensions

The fundamental parameters enable you to consult the catalogue for the range of dimensions of various bushes.

### Stiffness

The final selection of the bush will depend on the required stiffness for the application. In particular, length, diameter and the thickness of the elastomer required for the desired bush will be determined.

### Environmental conditions

Most of our standard bushes are in natural rubber. This has been chosen because of its good dynamic qualities.

In normal conditions of use, the types of rubber used guarantee a good life and limit creep in particular.

The following conditions of use are considered abnormal :

- temperatures above 70° C;
- prolonged contact with aggressive fluids;
- aggressive environments, such as oil or petrol;
- prolonged contact with acids or alkalis;
- aggressive atmospheres (e.g. ozone, chlorine).

Use in these conditions can accelerate ageing of the bushes, and cause the degradation or even the destruction of the rubber. An abnormally aggressive environment can, in particular, increase the deformation of the bush (by creep).

Flexible bushes can be made with special elastomers which are capable of surviving the abnormal conditions mentioned above and enabling the bushes to perform well.

**Our technical services are at your disposal to reply to your questions about the properties of our various elastomers.**

## 5 - AN EXAMPLE OF A SELECTION

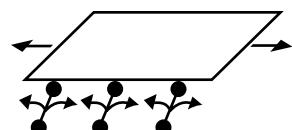

For the bushes of a vibrating carpet.

Weight : 120 daN. Number of fixing points : 6

Angle of movement :  $\pm 2^\circ$ . Frequency: 600 cycles/mn = 10 Hz

Radial load per bush :  $\pm 20$  daN (evenly loaded).

Amplitude reduction coefficient at 10 Hz :  $m = 0.18$ . Torsion angle :  $\frac{2^\circ}{0.18} = 11^\circ$

In this case, the axial and conical parameters are not of major importance in the selection of the bushes. Since the fixing diameter of the connecting rods is 10 mm, we would select reference 561205 from the bush catalogue.

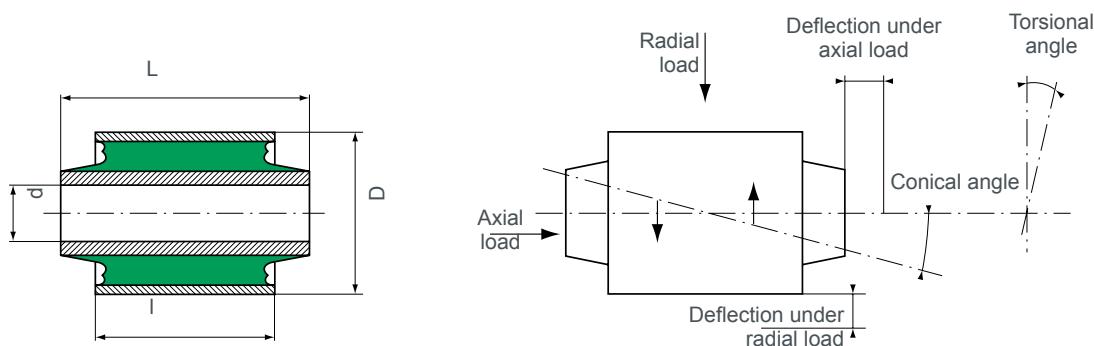

$d = 10$  mm     $D = 22$  mm     $L = 17$  mm     $I = 15$  mm    Radial load = 40 daN  
Maximum torsion angle =  $25^\circ$

**Therefore, for the given application we would use : 12 Flexibloc 561205 bushes.**

# 6 - CATALOGUE OF FLEXIBLE BUSHES

## SIMPLE BUSHES

### FLEXIBLOC® AND SILENTBLOC®

**FLEXIBLOC® - Fully Bonded** : The elastomer is bonded to the 2 concentric tubes, Parts Number 560..., 561...

**SILENTBLOC® - Prestressed Elastomer** : The ring of "adherite" is inserted by force between the 2 concentric tubes, Parts Number 861..., 862..., 864...

**BL** : Bushes with a lateral stop.

# PIVOT BUSHES

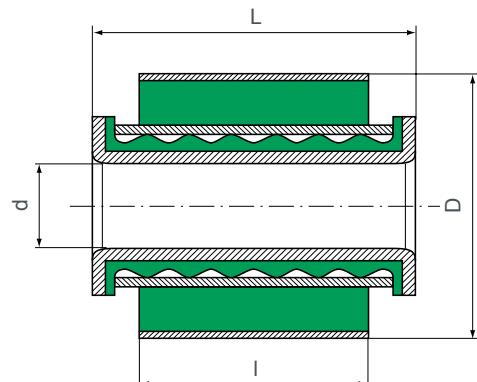

Fig. 1

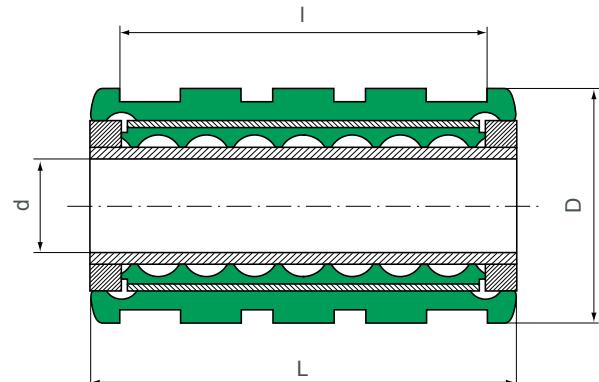

Fig. 2

## FLUIDBLOC® AND TOURIFLEX®

These are high precision bushes; they are made of injected polyurethane and can resist oil, water, ozone, etc.

These “pivoting” bushes are characterised by their very low torsional resistance (0.1 to 0.2 N.m). They can ensure a complete rotation ( $360^\circ$ ), and have no requirements for maintenance because they have a permanent lubricant.

They don't need a high precision housing, and the load to remove the bushes is between 1500 and 1800 daN.

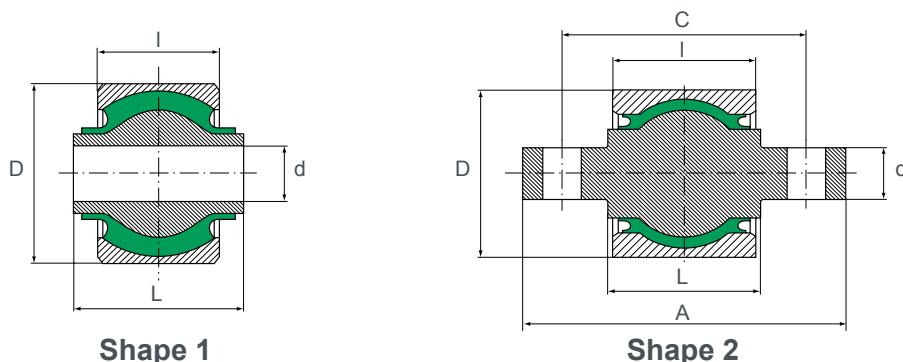

There are many applications, such as : leaf spring bushes for vehicles not exceeding 5 tons.

# 1 - GENERAL

## 1.1 - Function of a flexible coupling

When transmitting torque from a drive shaft to a driven shaft, flexible couplings :

- absorb and dampen **irregularities** in the **torque**;
- distribute peak loads;
- allow misalignments and offsets between the shafts;
- permit some distortions in the mounting beds;
- avoid the unwelcome constraints that may occur if a rigid coupling were fitted in the same conditions;
- allow a lighter construction, with wider tolerances, and lower cost.

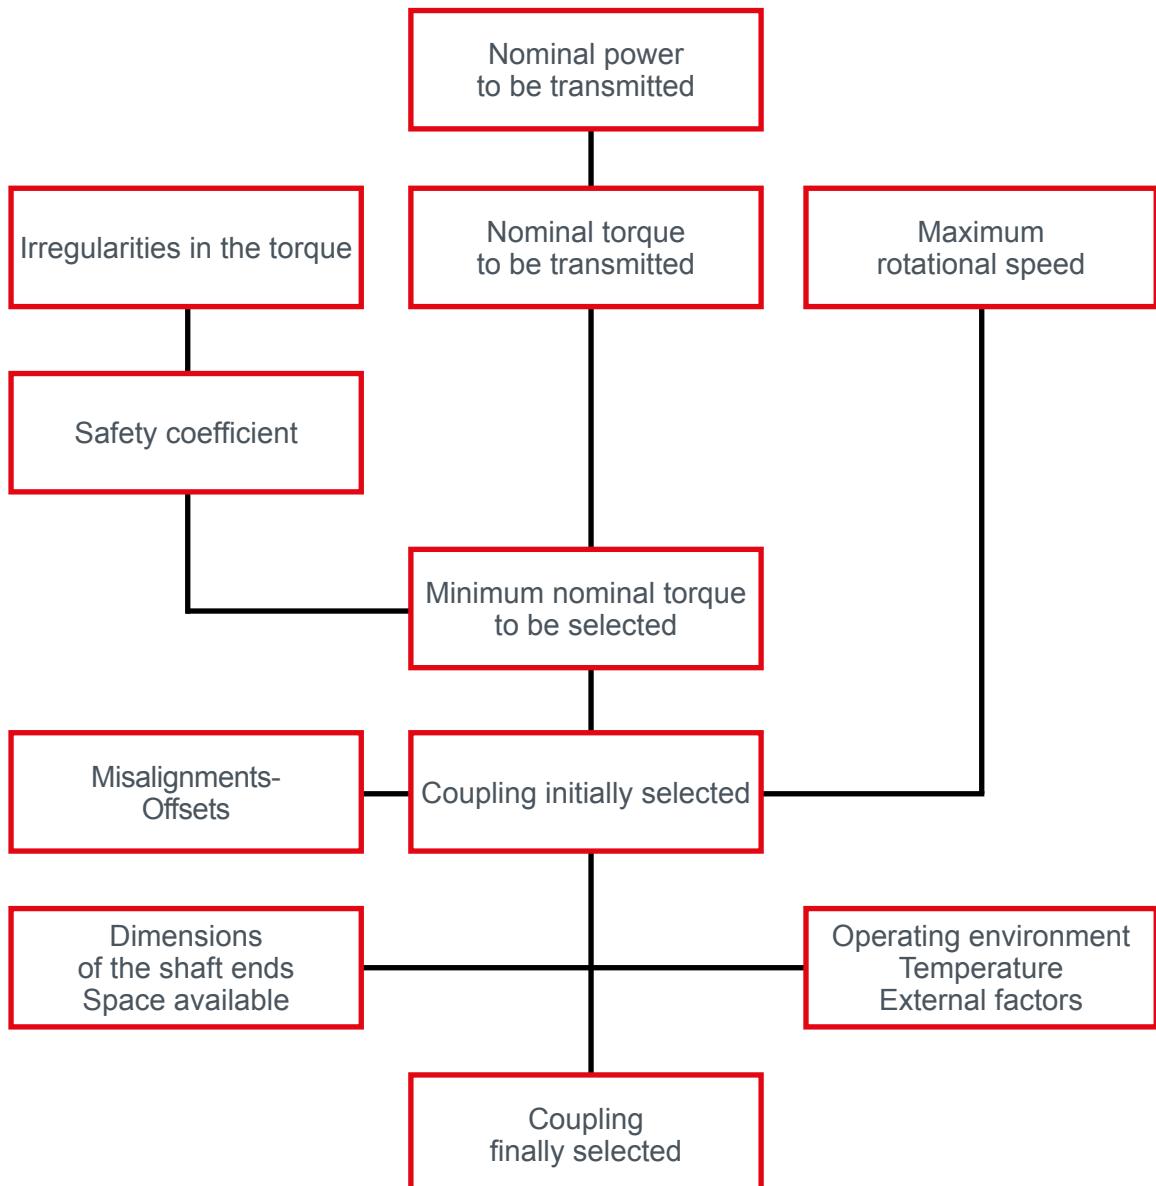

In particular, a flexible coupling is absolutely essential if the machines that are coupled are on **flexible mountings**.

Moreover, there is **no play** in a flexible coupling, and it therefore **runs silently, without friction and does not need to be greased**.

## 1.2 - Selection parameters

The procedure for selecting a coupling is set out below :

In order to select a flexible coupling, therefore, the following parameters should be known :

- nominal torque to be transmitted;
- safety coefficient - Nominal torque of the coupling;
- stiffness - Misalignments - Offset;
- dimensions - Space available;
- operating environment - Temperature - External factors;

### 1.2.1 - Nominal torque to be transmitted

The nominal torque is the main factor which determines the dimensions of the coupling between the shafts of the machines that are connected directly to it.

The nominal torque to be transmitted is a function of the nominal power to be transmitted and the rotational speed.

$$T \text{ (N.m)} = \frac{7\,024 \times P \text{ (bhp)}}{N \text{ (rpm)}}$$

$$T \text{ (N.m)} = \frac{9\,550 \times P \text{ (Kw)}}{N \text{ (rpm)}}$$

**The nominal power** to be transmitted is that of the driving machine expressed in kilowatts (Kw) or brake horsepower (bhp). The couplings in PAULSTRA's standard range can transmit power from 1 Kw to more than 2,000 Kw.

**The rotational speed** expressed in revolutions per minute is that of the driving machine and must be less than the maximum speed accepted by the coupling.

The couplings in PAULSTRA's standard range allow high speeds (up to 10,000 rpm), which is greater than electric motor speeds. The maximum speeds indicated can be achieved only if great care is taken during assembly.

In addition to its elastic properties, the rubber has **viscous damping** characteristics which dampen the oscillations and in particular the oscillations which might become excessive during transient periods of peak load.

The dampening effect is produced by irreversibly absorbing the energy which is thus converted into heat. In order to prevent the rubber being damaged by the resultant increase in temperature, especially if running at high speed, it is important to ensure the best possible alignment.

Once the coupling has been chosen, if difficult **peak load conditions** become evident, it would be advisable to choose a flexible coupling with different characteristics.

### 1.2.2 - Safety coefficient

The following factors should be taken into consideration when selecting the nominal torque of the coupling :

- irregularities in the torque characteristic of the driving and the driven machines ( $K_1$ );
- frequency of start-ups ( $K_2$ );
- number of hours in operation per day ( $K_3$ ).

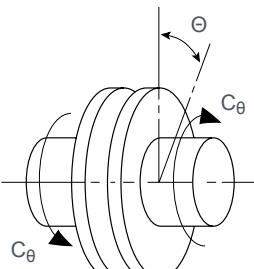

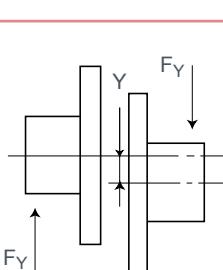

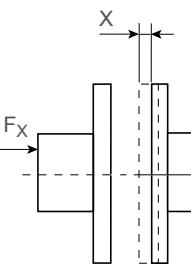

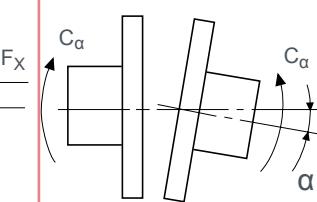

The product K of these three coefficients  $K_1$ ,  $K_2$ ,  $K_3$ , is called the safety coefficient or the load factor.

**Nominal torque of the coupling = Nominal torque to be transmitted x safety coefficient.**

**An excessive safety coefficient should be avoided as this tends to lead to the selection of a coupling that is oversize and too stiff.**

### 1.2.3 - Stiffness - misalignments - offsets

A flexible coupling always allows, to varying degrees depending on type, structure and dimensions, displacements in four ways : axial, radial, conical and torsional. A stiffness defined for each of these cases. The stiffness affects the way in which the coupling reacts when subjected to each of the various possible displacements.

Torsional or polar stiffness	Radial stiffness	Axial stiffness	Conical stiffness
			
$K_\theta = \frac{\text{Torque}}{\text{Angular}} = \frac{C_\theta}{\Theta}$ expressed in m.kN/radian	$K_y = \frac{\text{Radial force}}{\text{Corresponding radial displacement}} = \frac{F_y}{Y}$ expressed in m.kN/radian	$K_x = \frac{\text{Axial force}}{\text{Corresponding axial displacement}} = \frac{F_x}{X}$ expressed in daN/mm	$K_\alpha = \frac{\text{Misalignment torque}}{\text{Angular misalignment}} = \frac{C_\alpha}{\alpha}$ expressed in m.kN/radian

It can be seen that a coupling can absorb misalignment more easily if it is very flexible (ie it is less stiff). With flexible couplings «alignment» is not an arduous, high precision operation as is the case with rigid couplings.

The forces generated by flexible couplings, which are transmitted to the shafts and supports, are, of course, proportional to the magnitude of the misalignments.

### 1.2.4 - Dimensions – space occupied

When choosing the coupling, one should bear in mind :

- the dimensions (diameter and length) of the ends of the shafts to which the flanges of the coupling will be fitted;
- the space (diameter and length) available between the machines for the coupling.

### 1.2.5 - Operating conditions – temperature – external factors

The natural rubber which has been selected for most of our standard couplings on the basis of its good dynamic qualities :

- is very good for the operating environment of most machines;
- is not affected by accidental contact with oil or petrol;
- easily withstands temperatures up to 70°C.

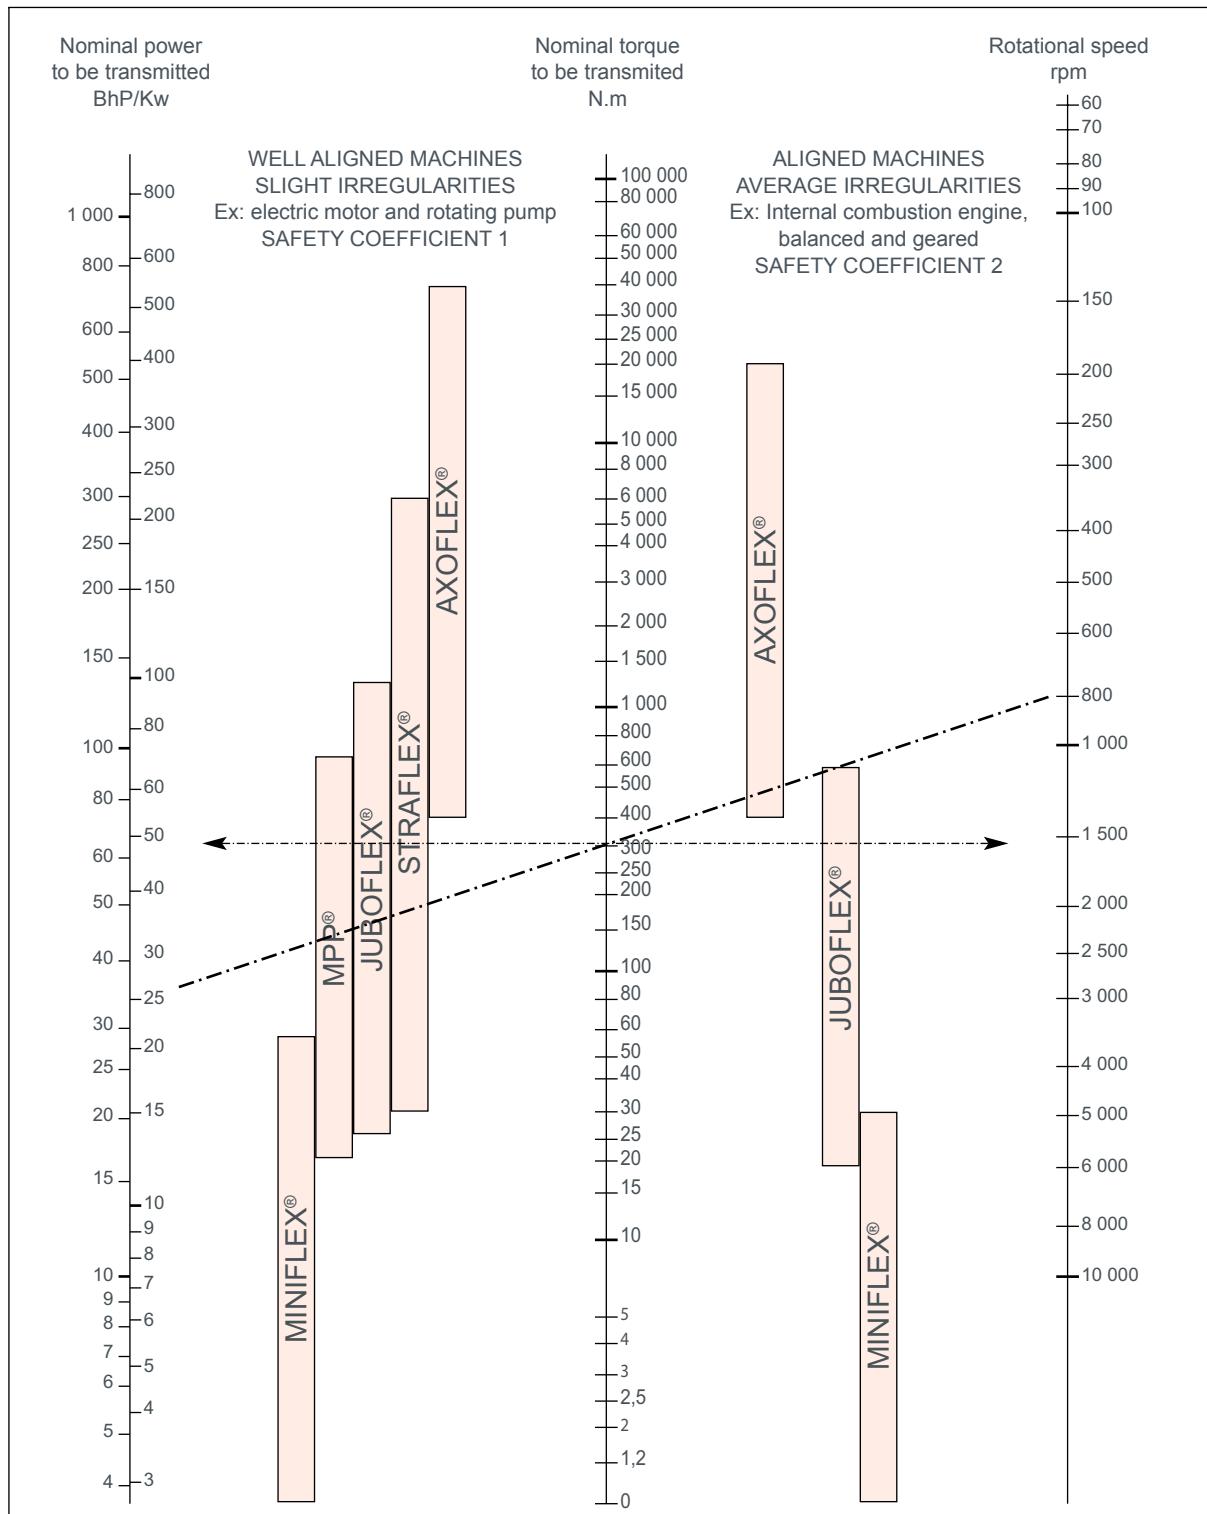

A temperature which is permanently higher will lead to progressive deterioration in the properties of the rubber and it would therefore be advisable to consider special compounds.

Most PAULSTRA flexible couplings can be made using various types of special compounds that can withstand above average temperatures and remain serviceable in unusual conditions: prolonged contact with hydrocarbons, acids, alkalis or with unusual gases (ozone, chlorine . . ).

If operating conditions are different from those defined for our standard couplings, contact our Technical Department.

## 2 - SELECTING A COUPLING

### 2.1 - Calculating the nominal torque to be transmitted

Example : to calculate the torque, draw a straight line between the points representing the power to be transmitted and the rotational speed of the machine. The intersection at the central scale indicates the torque value.

Ex. : 25 Kw at 800 rpm 300 N.m. Draw an horizontal line through this point.

The type of coupling will then be selected, bearing in mind the safety coefficient to be applied and the flexibility required. Refer to the selection chart, page 300.

## 2.2 - Safety coefficient

### 2.2.1 - Coefficient $k_1$ = driving machine/driven machine

Driving Machine			Driven machine	Examples of driven machines
Electr. motor or turbine	Piston Engine			
4 to 6 cylin.	1 to 3 cylin.			
1	1,2	1,4	① Smooth operation - Very low inertia	<ul style="list-style-type: none"> <li>Lay shaft • Lighting generator • Series of shafts</li> <li>Centrifugal pump • Centrifugal fan...</li> </ul>
1,2	1,4	1,7	② Irregular operation - Low inertia	<ul style="list-style-type: none"> <li>Fluid agitator • Conveyor belt • Lift</li> <li>Rotating machine tools for wood and metal</li> <li>Light textile machines • Folding machines</li> <li>Geared pumps • Paddle pumps • Fans...</li> </ul>
1,4	1,7	2	③ Irregular operation - Average inertia	<ul style="list-style-type: none"> <li>Agitator for heavy liquid • Rotary compressor</li> <li>Roller conveyor • Shredders • Rotary ovens</li> <li>Wood machinery (planing machine, band-saw . . .)</li> <li>Printing machines • Mixers • Hoists</li> <li>Punch • Centrifugal pump for loaded liquid...</li> </ul>
1,7	2	2,4	④ Irregular operation - Average inertia - Average shocks	<ul style="list-style-type: none"> <li>Concrete mixer • Bar shredder • Shot blaster</li> <li>Piston compressor with fly wheel • Chain conveyor</li> <li>Crane • Light rolling mill • Flour mills • Power hammer • Loom</li> <li>Piston pump with fly wheel • Horizontal mills</li> <li>Winches • Mine fans...</li> </ul>
2	2,4	2,8	⑤ Irregular operation - High inertia - Hard shocks	<ul style="list-style-type: none"> <li>Hammer crushers • Calender (rubber, textiles...)</li> <li>Piston compressor with low inertia fly wheel • Wood shredder</li> <li>Excavator • Rolling mill • Piston pump with low inertia fly wheel</li> <li>Forging press • Paper press • Vibrating sieve...</li> </ul>
2,4	2,8	3,3	⑥ Irregular operation - Very high inertia - Very hard shocks	<ul style="list-style-type: none"> <li>Piston compressor without fly wheel • Crusher</li> <li>Welding generator • Heavy rolling mill • Brick press</li> <li>Piston pump without fly-wheel...</li> </ul>

### 2.2.2 - Coefficient $k_2$ = number of start-ups

Depending on driving machine - driven machine See table K1	NUMBER OF START-UPS PER HOUR				
	1	10	30	60	120
①	1	1,2	1,3	1,5	1,6
② ③	1	1,1	1,2	1,3	1,4
④ ⑤ ⑥	1	1,05	1,1	1,2	1,2

### 2.2.3 - Coefficient $k_3$ = number of hours of daily operation

Number of operating hours per day	0 - 2	2 - 8	8 - 16	16 - 24
Coefficient K3	0,9	1	1,1	1,2

#### **2.2.4 - Nominal torque of the coupling**

**Nominal torque of the coupling = Nominal torque to be transmitted x safety coefficient.**

The safety coefficient, K, is the product of the three coefficients  $K_1$ ,  $K_2$  and  $K_3$ .

The above parameters should enable one or two types of coupling to be selected which are suitable for the application required.

The final choice will be made on the basis of the data sheets for the coupling selected, checking:

- the dimensions allowed for the shaft ends;
  - the space available;
  - the exact values of the misalignments, offset, stiffness;
  - and any other parameter (eg : installation).

## 2.3 - Examples

### **2.3.1 - Electric motor – pump**

Driving machine Standard electric motor 160 M Power : 15 Kw Speed : 3000 rpm End of shaft Ø : 42 mm - length : 110 mm	Driven machine : Standard C2 water pump End of shaft Ø : 32 mm - length : 80 mm 30 start-ups/hour 8 hours operation per day
---	---

Nominal torque to be transmitted : chart indicates 5 N.m.

$$\text{Safety coefficient : } K_1 = 1 \quad K_2 = 1.3 \quad K_3 = 1 \quad \text{hence} \quad K = K_1 \times K_2 \times K_3 = 1.3.$$

Nominal torque of coupling :  $NT = 50 \text{ N.m} \times 1.3 = 65 \text{ N.m.}$

For machines which have a regular cyclic operation with correct alignment, it is not essential to have a highly flexible coupling and so the following couplings would be pre-selected :

CARDAFLEX 80 N.m  
 PAULSTRA MPP 80 N.m  
 STRAFLEX 100 N.m  
 All these couplings can be used at a speed of 3,000 rpm

In this case, the PAULSTRA MPP 80 N.m coupling would be chosen as it is the only one which will fit the diameter (42 mm) of the end of the motor shaft.

### **2.3.2 - Electric motor – compressor**

Driving machine :	Driven machine :
Standard 200 L electric motor	2 cylinder compressor with fly wheel
Power : 30 kW	End of shaft Ø : 60 mm - length : 110 mm
Speed : 1,500 rpm	Less than one start-up/hour
End of shaft Ø : 55 mm - length : 110 mm	8 hours operation per day

Nominal torque to be transmitted : chart indicates 190 N.m.

Safety coefficient :  $K_1 = 1.7$        $K_2 = 1$        $K_3 = 1$  hence       $K = 1.7$ .

Nominal torque of coupling :  $NT = 190 \times 1.7 = 320$  N.m.

The characteristics of the driven machine mean that high torsional flexibility is essential to absorb the cyclic irregularities.

The JUBOFLEX 350 N.m will therefore be selected, having checked that it can accommodate the shaft ends of the machines.

These examples are simple cases. In many instances, this method is adequate for selecting couplings. In more complex cases (cyclic vibrations, for example), it is advisable to consult our Technical Department.

# COUPLING

In order to make it easier to select the coupling required, this selection chart indicates the behaviour of PAULSTRA couplings when under stress.

This rating takes account of the possibilities of misalignments, offset and the resultant forces on the shafts and supports. Each condition is shown :

Braking force proportional to the speed of displacement.

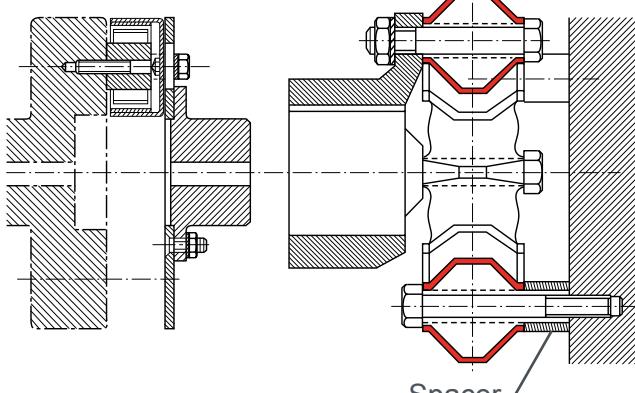

### 3 - EXAMPLES OF INSTALLATION

#### III.1 Flanged shaft mounting

The most common mounting

#### III.2 Flywheel mounting

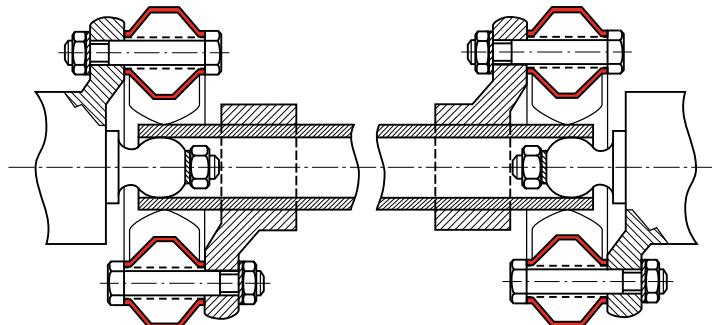

Mounted directly on flywheel

Ex. : AXOFLEX®

Mounting with spacer.

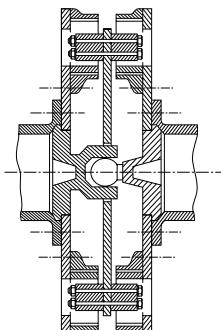

Ex. : JUBOFLEX®

#### III.3 Mounting on transmission shaft

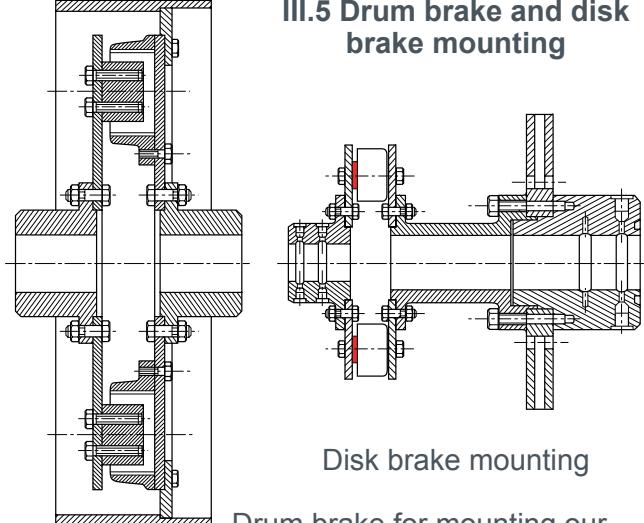

Assembly with centred transmission shaft. Ex. : JUBOFLEX®

#### III.4 Mounting in series

Increases the flexibility while  
keeping the torque constant.  
Ex.: AXOFLEX coupling with two  
sets of studs linked by an  
“anti-centrifuge” disk.

#### III.5 Drum brake and disk brake mounting

Disk brake mounting  
Drum brake for mounting our  
couplings with rings : AXOFLEX®,  
R.T.P®.

# 4 - DATA SHEETS

## MINIFLEX®

\*\*\* Torsional flexibility    \*\*\* Radial flexibility    Push fit Axial flexibility    \*\* Conical flexibility

### DESCRIPTION

- Flexible element
  - ① Natural rubber block bonded to;
  - ② V-shaped metal armatures.
- Flange : aluminium or cast-iron :
  - ③ DRIVE-SEGMENT

### OPERATION

The MINIFLEX coupling is designed with the following features :

- push fit assembly;
- compact, smooth cylindrical shape without protrusions;
- the flexible element is precompressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

#### Advantages

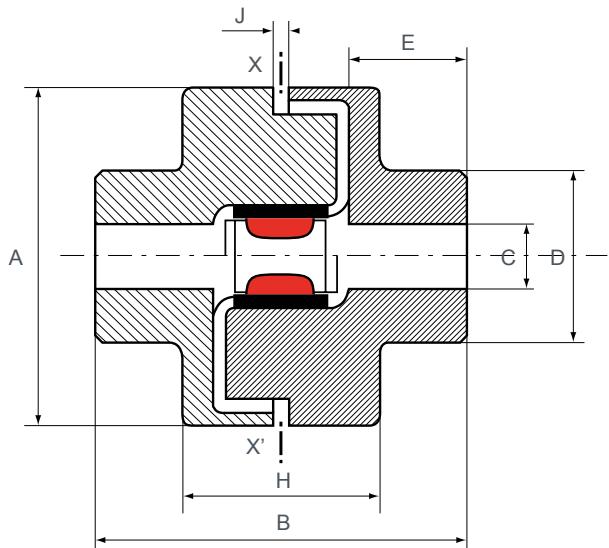

- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Exceptionally long-life ensured by precompressing the flexible element.
- Tolerance to large misalignment: avoids the need for precise alignment of the machines to be coupled.

#### Recommendation

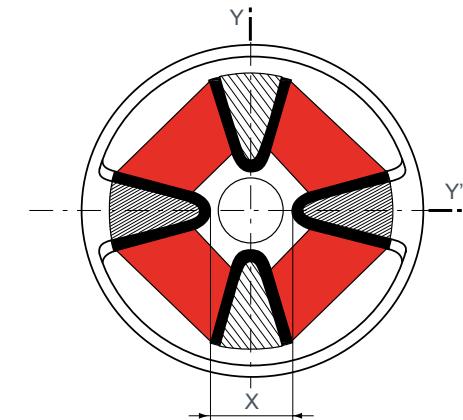

- It is recommended that the coupling should not be subjected to axial tension which might cause the flexible element to slip from the drive segment on the flange.

# ASSEMBLY

The coupling is assembled and disassembled axially which entails moving one of the machines. This procedure is not difficult and can be done quickly, as at least one of the machines being coupled is not heavy.

Method :

- fit an opposing pair of armatures of the flexible element half-way onto the drive segments of one flange;
- position the second flange;
- push the two flanges together to engage the armatures of the flexible element;
- release.

Example : electric motor/pump coupling mounted on fly wheel and grooved shaft.

# MPP®

\*\* Torsional flexibility    \* Radial flexibility    Push fit Axial flexibility    \* Conical flexibility

## DESCRIPTION

- Flexible element ① : polyurethane in the form of a Maltese cross.
- Flange ② : cast iron with drive segments ③ supplied unbored (except 633054 and 633055).

## OPERATING

The MPP coupling is designed with the following features :

- push fit assembly;
- smooth, compact cylindrical shape, without protrusions;
- the flexible element operates under compression;
- safe in use;
- temperature range -30°C to + 70°C in continuous operation.

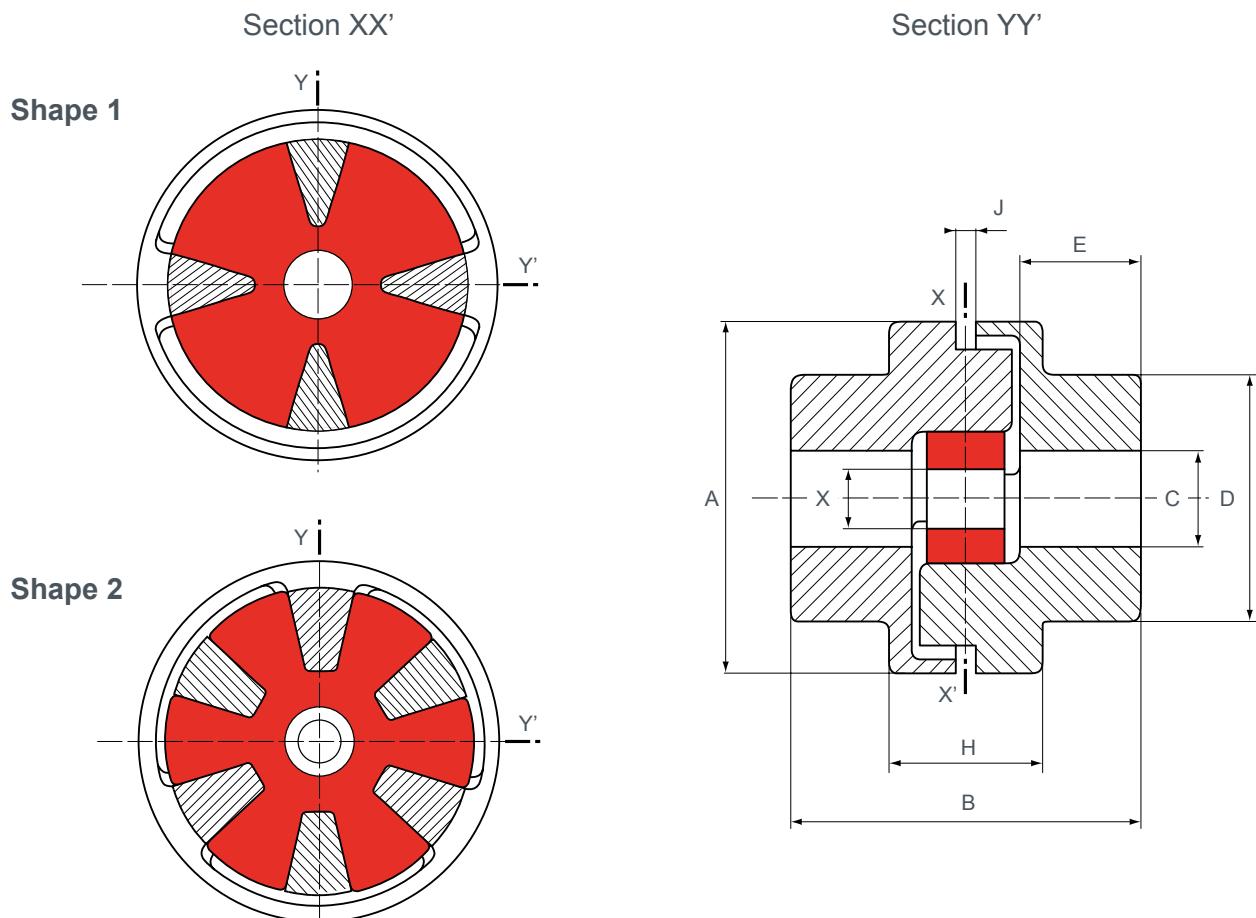

### Advantages

- Reduced size.
- Easy to use.

### Recommendation

- It is recommended that the coupling should not be subjected to axial tension which might cause the flexible element to slip off the drive segments on the flanges.

# JUBOFLEX®

\*\*\* Torsional flexibility

\*\* Radial flexibility

\*\*\* Axial flexibility

\*\*\* Conical flexibility

## DESCRIPTION

### Flexible element

- ① Precompressed natural rubber,
- ② Bonded metal spacers,
- ③ Precompression band (to be removed after installation).

### Flange

- ④ Die-cast steel (except 632320 which is cast-iron).

## OPERATION

The JUBOFLEX coupling is designed with the following features :

- radial disassembly without moving the machines that are coupled;
- the flexible element is precompressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

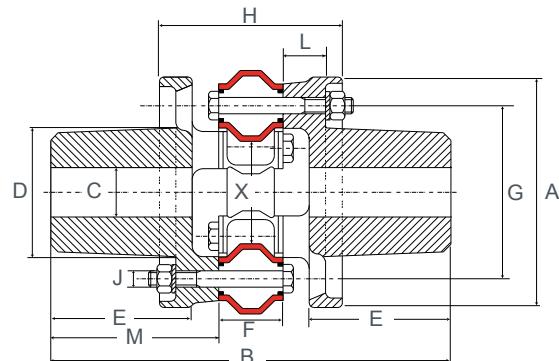

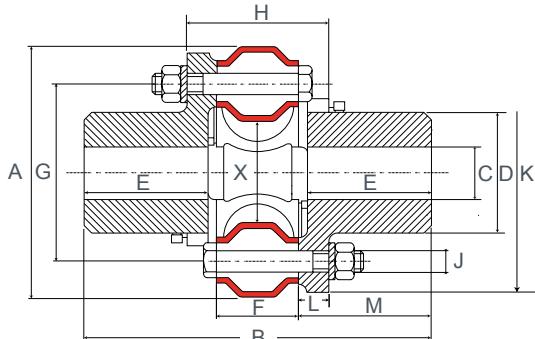

### Advantages

- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Very safe in use and the precompression ensures very high resistance to oscillation.
- Tolerance to large misalignment: avoids the need for precise alignment of the machines to be coupled.

### Recommendation

- In use, precompression is achieved by the fixing bolts, and the JUBOFLEX coupling operates without the precompression band round the flexible element.

# DIMENSIONS

**Flanges supplied unbored**

**JUBOFLEX Steel flanges except 632320**

**JUBOFLEX Cast-iron flanges : ref. 632320**

# JUBOFLEX® WITH SEPARATE HUB

\*\*\* Torsional flexibility    \*\* Radial flexibility    \*\*\* Axial flexibility    \*\*\* Conical flexibility

## DESCRIPTION

### Flexible element

- ① Precompressed natural rubber.
  - ② Bonded metal spacers.
  - ③ Precompression band (to be removed after installation).
- Flange
    - ④ Die-cast steel specially bored to fit the separate hub.
    - ⑤ Universal separate hub (not supplied by PAULSTRA).

## OPERATION

In addition to the characteristics described above, the separate hub used in conjunction with the JUBOFLEX coupling provides the advantage :

- Ready to assemble without machining the flanges.

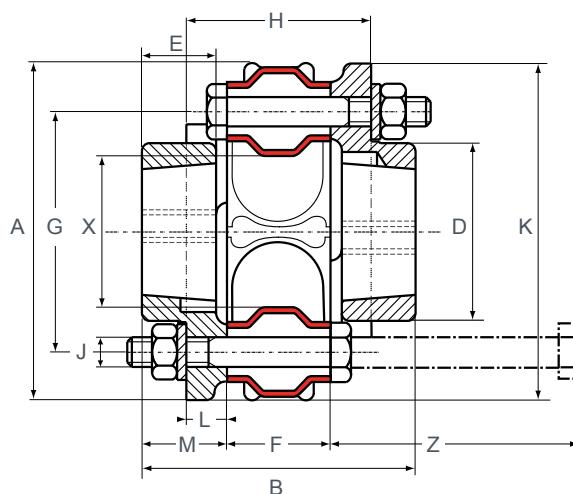

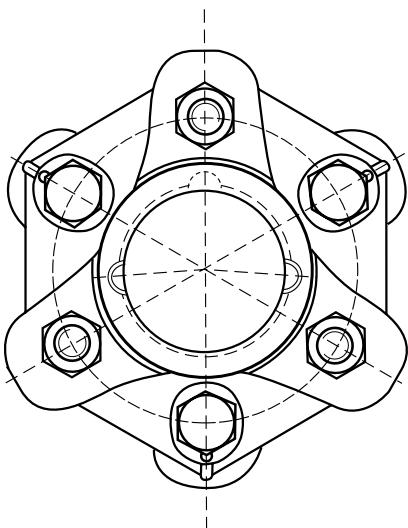

### Advantages

- Reduced size.
- Simplified axial positionning.
- Easy to assemble and disassemble.
- Reduction of costs by simplifying the machining required for the shafts and flanges.

### Recommendation

- In use, precompression is achieved by the fixing bolts and the JUBOFLEX coupling operates without the precompression band round the flexible element.

1 N.m ≈ 0,1 mkg

Please see current price list for availability of items.

# ASSEMBLY

- Precompression for the initial installation is achieved by a band ③ placed round the outside (our flexible elements are delivered with this band).
- Position the flexible element with its band to attach three non-adjacent holes to the three arms of one flange, and then the three other holes to the other flange.
- Tighten the bolts to the following torques :

Reference	Nominal torque TCN (N.m)	Torque value (N.m)
632027/632205	40	21
632023/632210	90	41
632017/632217	160	72
632029/632226	250	113
632031	350	240
632043	500	350
632025	700	350
632320	1 200	350

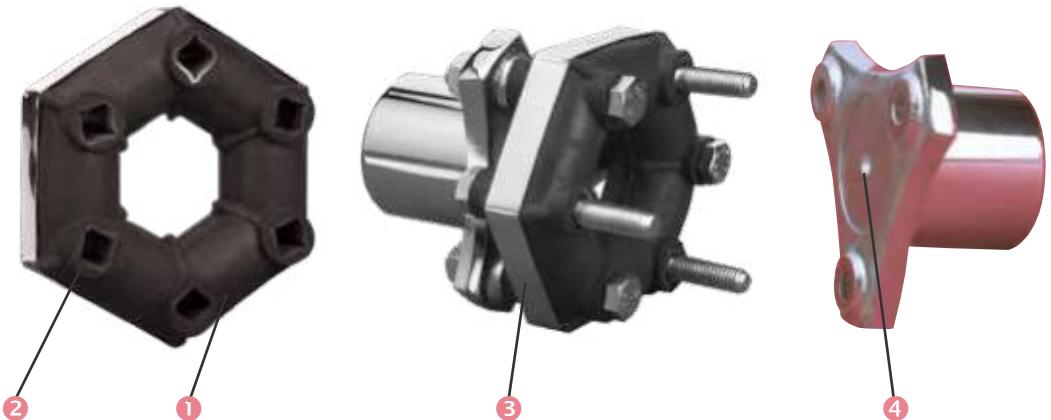

- Cut the original band or remove the disassembly band.

Example : internal combustion engine/generator coupling mounted on a ring attached to the fly wheel.

# JUBOFLEX ® "S"

\*\*\* Torsional flexibility    \*\* Radial flexibility    \*\*\* Axial flexibility    \*\*\* Conical flexibility

## DESCRIPTION

- Flexible element
  - ① Precompressed natural rubber.
  - ② Bonded metal reinforcing mountings.
  - ③ Precompression band (to be removed after installation).
- Flange
  - ④ Die-cast steel (except 632267 which is cast-iron).

## OPERATION

The JUBOFLEX «S» coupling is designed with the following features :

- radial disassembly without moving the machines that are coupled;
- the flexible element is compressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

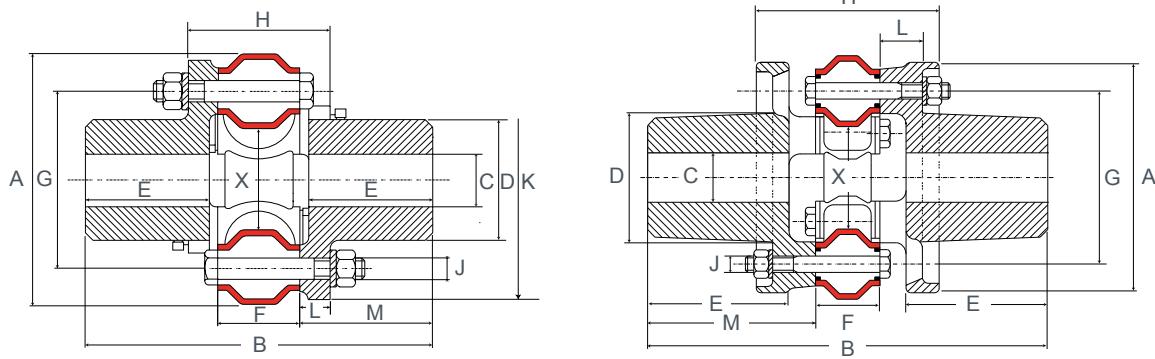

### Advantages

- JUBOFLEX «S» has a greater load capacity than the standard JUBOFLEX.
- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Due to the precompression, the JUBOFLEX «S» has very good resistance to torsional peaks.
- Tolerance to large misalignment: avoids the need for precise alignment of the machines to be coupled.

### Recommendation

- In use, precompression is achieved by the fixing bolts, and the JUBOFLEX «S» coupling operates without the precompression band round the flexible element.

# STRAFLEX®

\* Torsional flexibility    \* Radial flexibility    \*\* Axial flexibility    \*\* Conical flexibility

## DESCRIPTION

- Flexible element
  - ① Metallic bobbins linked together by rayon fibres.
  - ② The whole unit ① is potted in natural rubber and is hexagonal.
- Flange
  - ③ forged steel.

## OPERATION

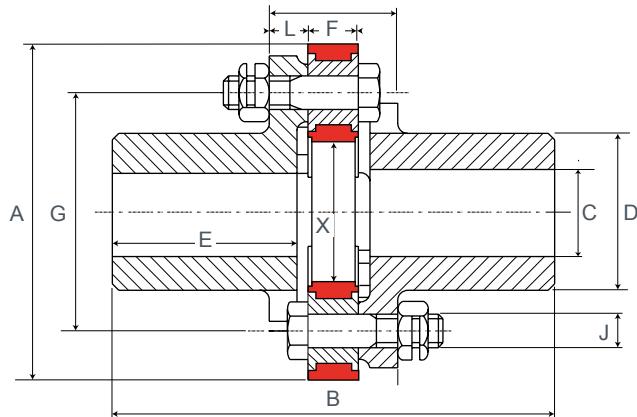

The STRAFLEX® coupling is designed with the following features :

- radial disassembly without moving the machines that are coupled;
- reduced size;
- used at relatively high rotational speeds.

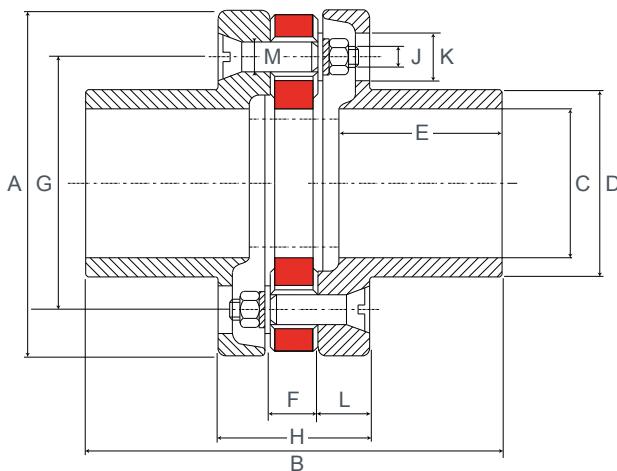

### Recommendation

- The reinforced textile structure means that it has a low tolerance to irregularities in the torque.

# DIMENSIONS

**Assembly of models ref. 635301, 635302, 635303, 635304**

**Flanges supplied unbored**

**Assembly of models ref. 635105, 635106, 635107: screws with countersunk heads**

**Warning :** the coupling ref. 635100 is equipped with melted studs instead of the standard bolts. Its assembly is done simply by pushing the elements on the flanges.

# STRAFLEX® WITH SEPARATE HUB

\* Torsional flexibility      \* Radial flexibility      \*\* Axial flexibility      \*\* Conical flexibility

## DESCRIPTION

- Flexible element
  - ① Metallic bobbins linked together by rayon fibres.
  - ② The whole unit ① is potted in natural rubber and is hexagonal.
- Flange
  - ③ Forged steel specially bored to accommodate the separate hub.
  - ④ Universal separate hub (not supplied by PAULSTRA).

## OPERATION

In addition to the characteristics described above, the separate hub used in conjunction with the STRAFLEX coupling provides the advantage: ready to assemble without machining.

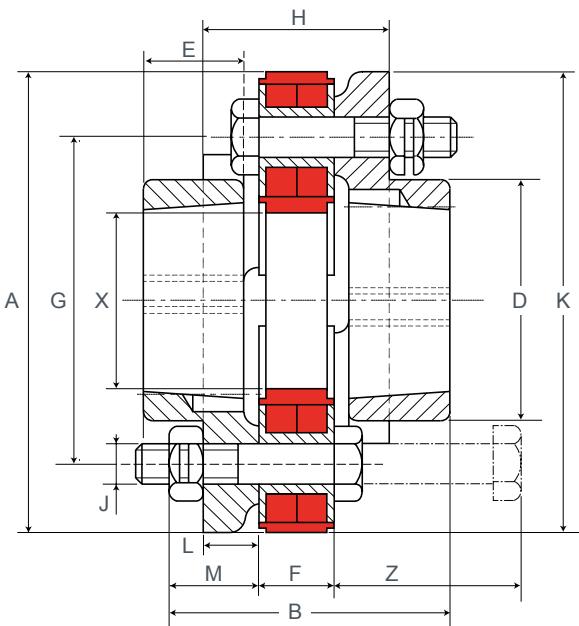

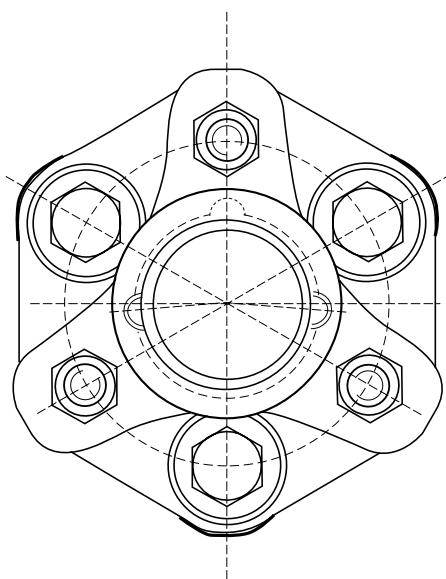

### Advantages

- Reduced size.
- Simplified axial positionning.
- Easy to assemble and disassemble.
- Reduction of costs by simplifying the machining required for the shafts and flanges.

### Recommendation

- The reinforced textile structure means that it has a low tolerance to irregularities in the torque.

# DIMENSIONS

6 000	3 000	2	75	200	172	3,44

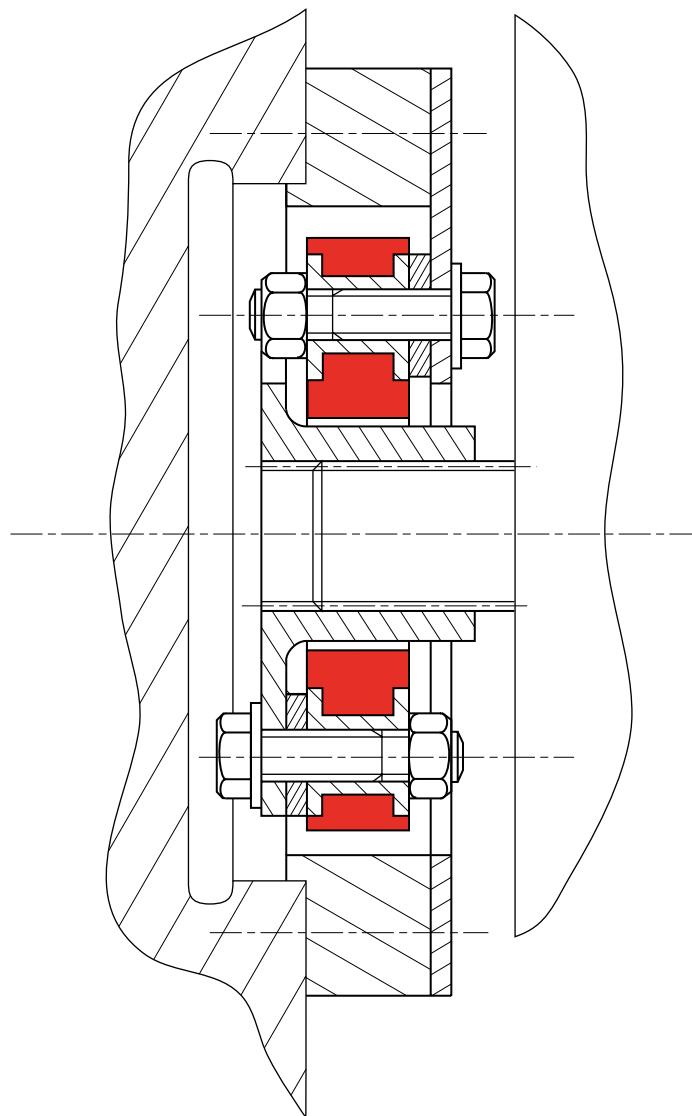

1 N.m ≈ 0,1 mkg

# ASSEMBLY

Method :

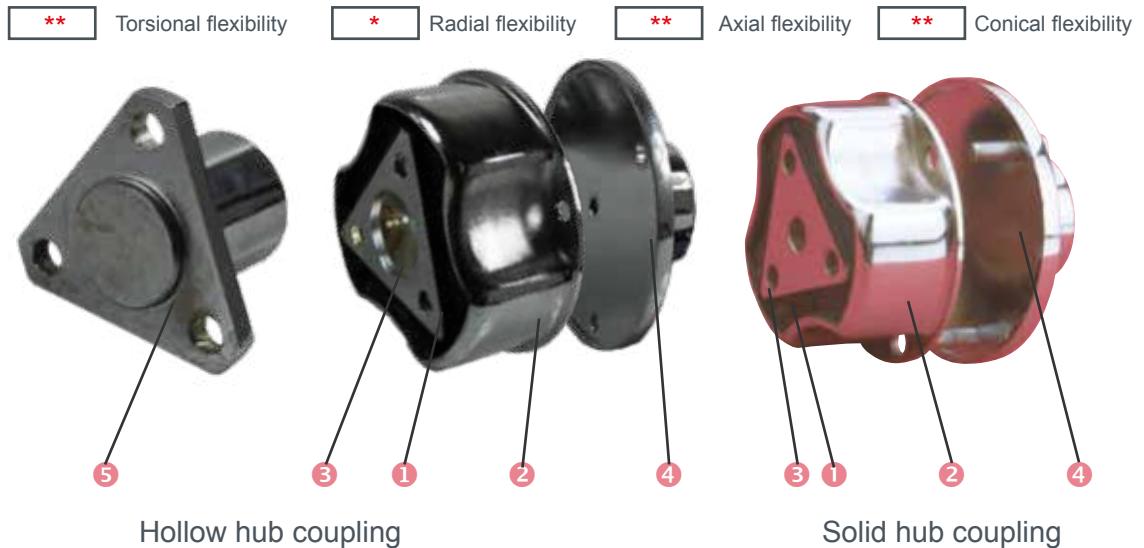

- mount the flanges on the shafts of the machines to be coupled;
- position the flexible element to attach three non-adjacent bobbins to one flange with bolts, then attach the three other bobbins to the second flange.

**NOTE** : For the 635100 coupling, the bolts are replaced by welded studs and so this must be assembled by pushing the flanges together.

Example : electric motor/volumetric pump coupling : mounted on channelled shaft and flywheel.

# CARDAFLEX®

## DESCRIPTION

There are two variations of the CARDAFLEX coupling : hollow hub and solid hub :

- Flexible element
  - ① Formed of solid natural rubber.
  - ② External steel surround, bonded to the rubber.
  - ③ Triangular hub: a hollow hub bonded to the rubber and attached to the flange ⑤, or a solid hub which accommodates a grooved or keyed shaft.
- Steel flanges
  - ④ round.
  - ⑤ triangular.

## OPERATION

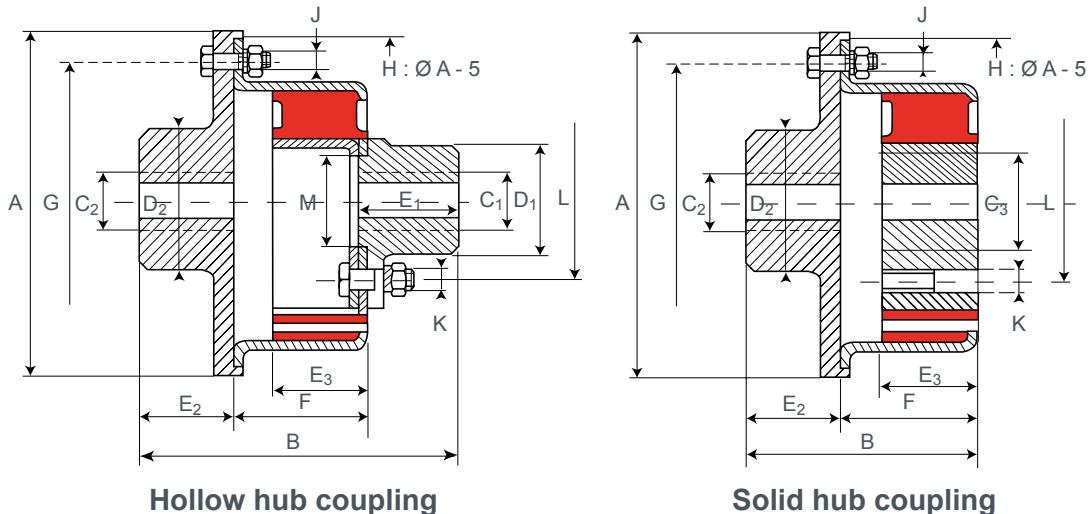

The CARDAFLEX coupling is designed with the following features :

- safe in use;
- fairly low conical stiffness;
- compact shape;
- Good performance at high speeds.

### Advantages

- Especially in the case of the CARDAFLEX solid hub coupling, the space occupied by the unit is much reduced.
- The outer surround of the flexible element can be centred directly onto the flywheel of one of the machines to be coupled.

# ASSEMBLY

Method :

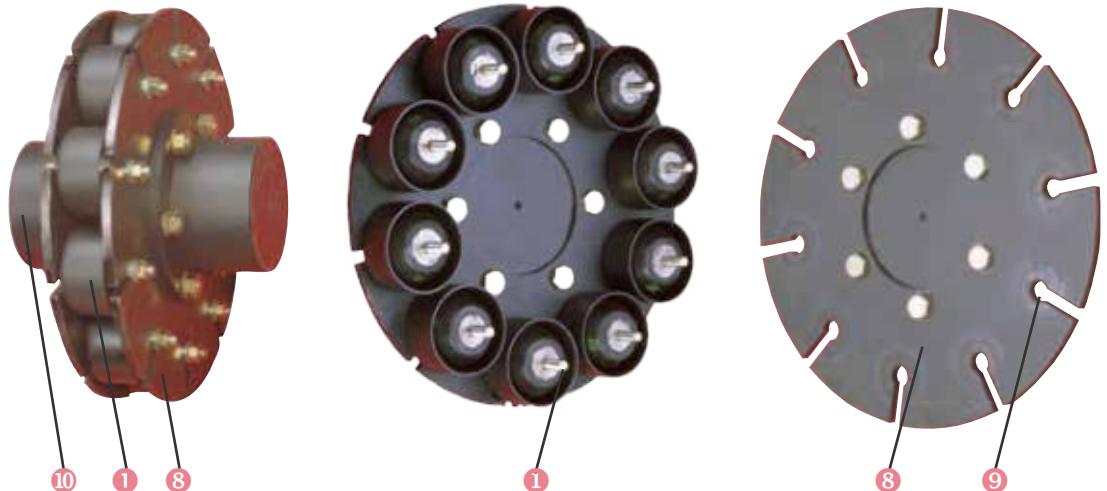

- mount the round flange onto the shaft of one machine.
- Mount :
  - the triangular flange onto the other shaft (hollow hub coupling);
  - the flexible element onto the other shaft (solid hub coupling).
- Attach the flexible element to the round flange.

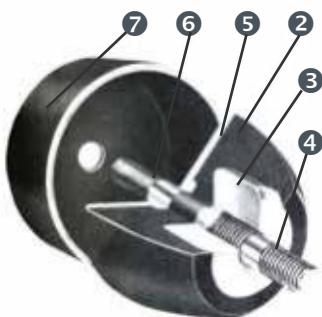

Example : internal combustion engine/hydraulic pump coupling : mounted on keyed shaft and on pulley.

# RADIAFLEX® RTP

\* Torsional flexibility    \* Radial flexibility    See Data Sheet    Axial flexibility    Conical flexibility

## DESCRIPTION

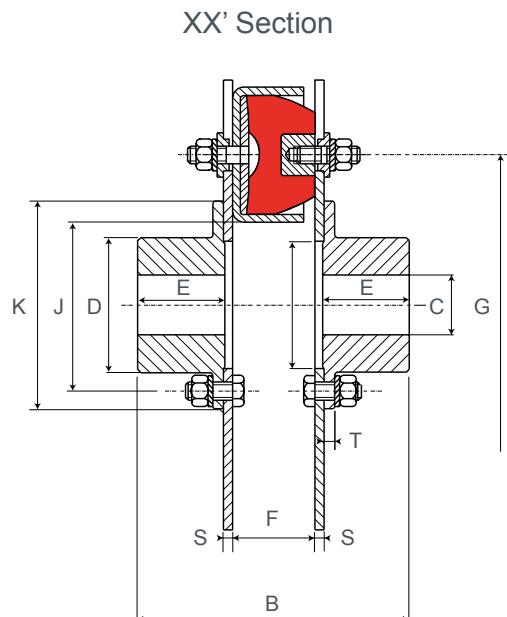

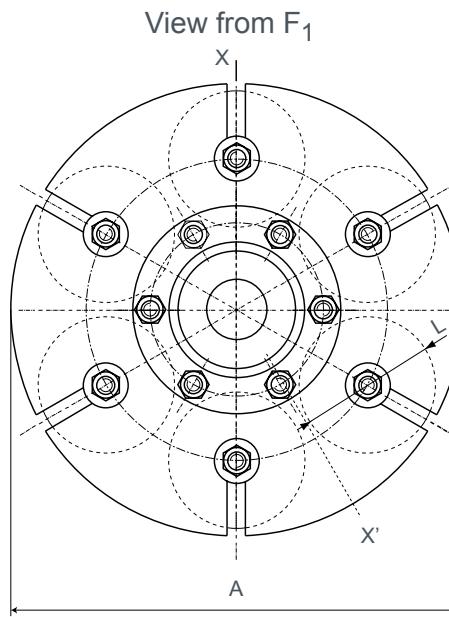

- Flexible element made up of a variable number of flexible studs ① depending on the torque to be transmitted.
- Solid natural rubber blocks in the form of a truncated cone.
- Internal armature bonded to the rubber.
- Threaded stud.
- External armature bonded to the rubber.
- Studding welded to armature.
- Cylindrical metal cover.
- Steel disks  
⑧ Two identical disks, bolted to the flanges ⑩ and with slits ① to house the studs ⑨.
- Flanges  
⑩ die-cast steel.

## OPERATION

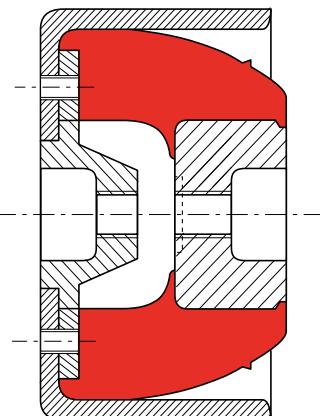

The RADIAFLEX RTP coupling is designed with the following features :

- the studs can be removed radially without moving the coupled machines;
- at low and average torque : the rubber operates under compression;
- at high torque : there is progressive thrust of the rubber against the metal cover ③;
- safe in use;
- it can absorb the effects of tension or compression axially (for example: push and pull of a helical screw).

# DIMENSIONS

## Alternative mount :

The alternative mount **526401Δ60** is softened. Its radial stiffness is equal to 2/3 of the standard mounting ref. **522131Δ60**.

**Warning :** a coupling equipped with the alternative mounts **526401** can only transmit 80% of the torque of the standard version.

# ASSEMBLY

Method :

- mount each of the flanges onto the ends of the corresponding shafts;
- use the specially machined recess to centre the disks onto the flanges and screw together;
- attach the external armature of the studs to the appropriate disk;
- attach the internal armature of the studs to the other disk.

Note :

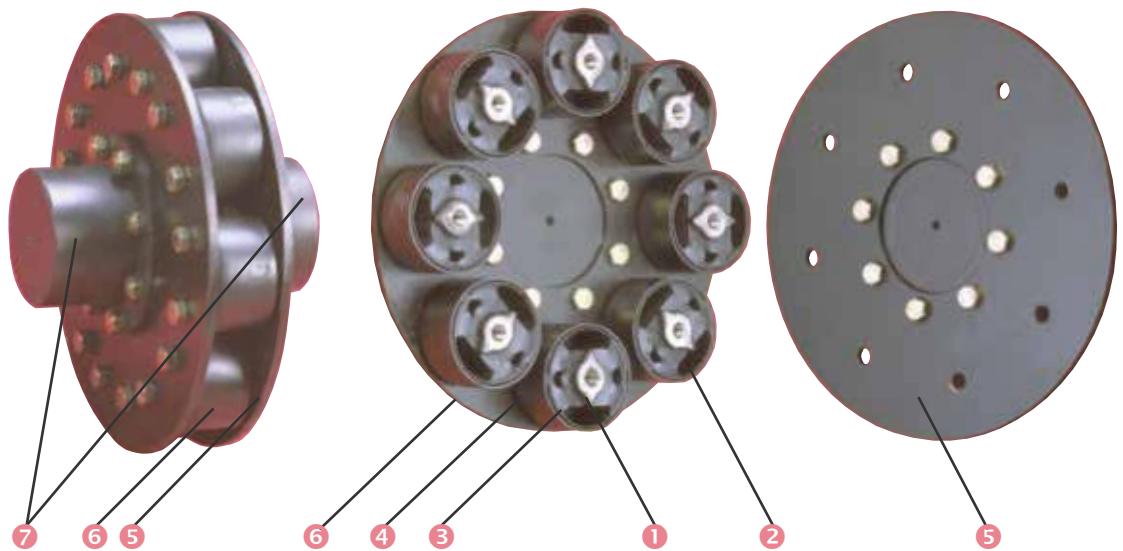

The slits ⑨ are designed to take the loose locating sleeves ⑪ to enable the individual flexible studs ⑬ to be mounted and removed radially.

Torque to be applied to the stud fixing bolts :

- Stud RTP2 : 522090 Ø 12 → 75 N.m.
- Stud RTP4 : 522131 Ø 16 → 185 N.m.
- Stud RTP6 : 522240 Ø 24 → 640 N.m.

# AXOFLEX®

\* Torsional flexibility    \* Radial flexibility    \*\* Axial flexibility    \* Conical flexibility

## DESCRIPTION

- **Flexible element** comprising a variable number of flexible bushes, depending on the torque to be transmitted.
  - ① Inner with tapped or smooth holes (normal mounting or on flywheel).
  - ② Precompressed natural rubber bonded to inner ① and to outer the half-cylinders ③.
  - ③ Half-cylinders bonded to the rubber.
  - ④ Outer housing ensuring precompression of rubber by exerting pressure on the half-cylinders ③.
- **Steel disks**
  - ⑤ Flange to which the inner studs are attached (normal mounting).
  - ⑥ Disk to which the studs are attached (flywheel mounting).
- **Die cast steel hubs**
  - ⑦ The two hubs are identical. They may be bolted to disks ⑤ or ⑥ depending on the mounting used.

## OPERATION

The AXOFLEX coupling is designed with the following features :

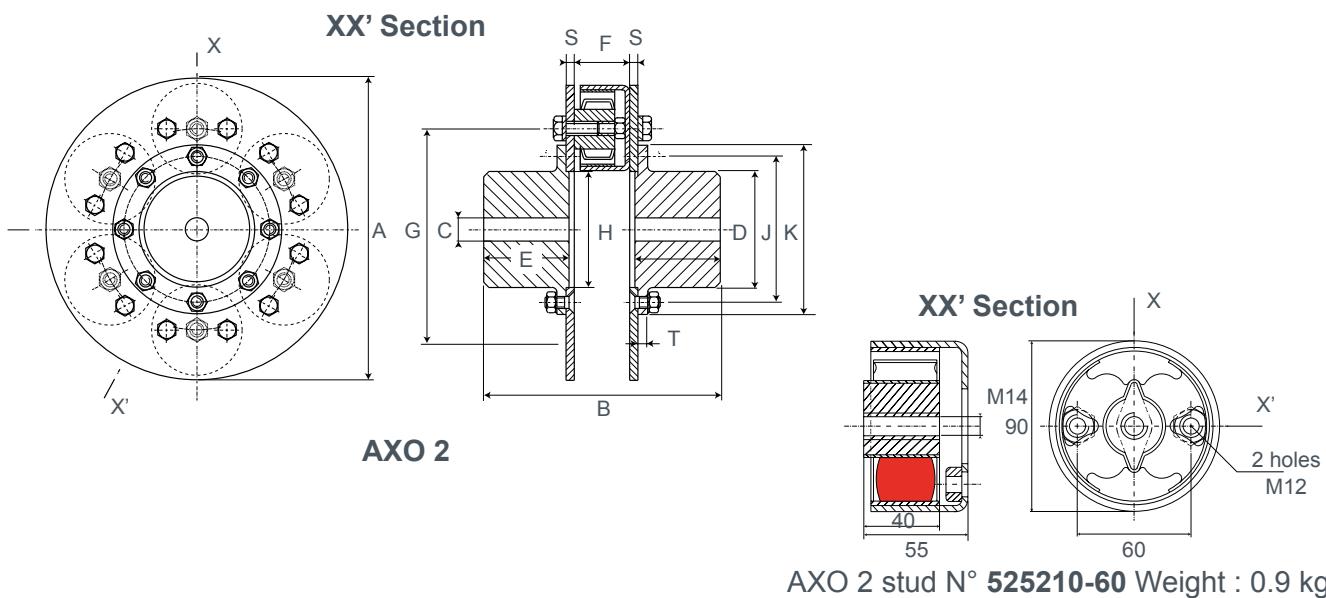

- radial disassembly without moving the machines that are coupled (usually very large machines);
- precompression of the rubber which limits operation under tension.

### Advantage

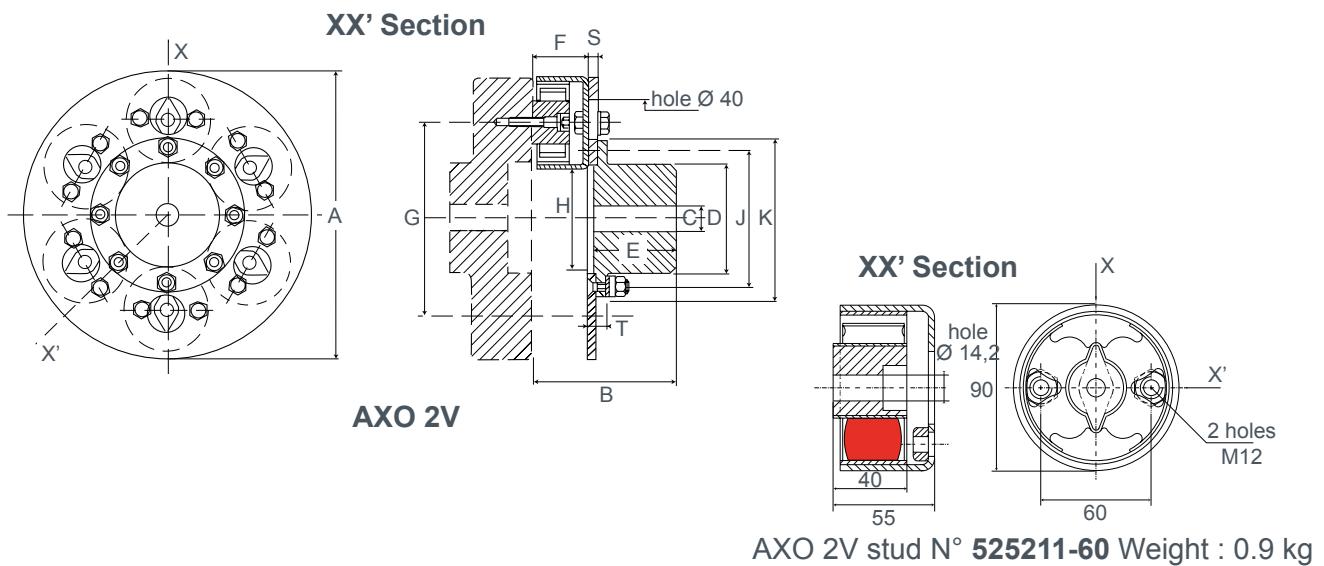

- Good axial flexibility which allows great axial displacement, for example in the case of conical rotor machines.

# ASSEMBLY

## Method : (normal) :

- attach each of the flanges to the ends of the appropriate shafts;
- use the specially machined recess to centre the disks onto the flanges and screw together;
- attach the external armature of the studs to the appropriate disk;
- attach the internal armature of the studs to the other disk.

Torque for the bolts attaching the studs.

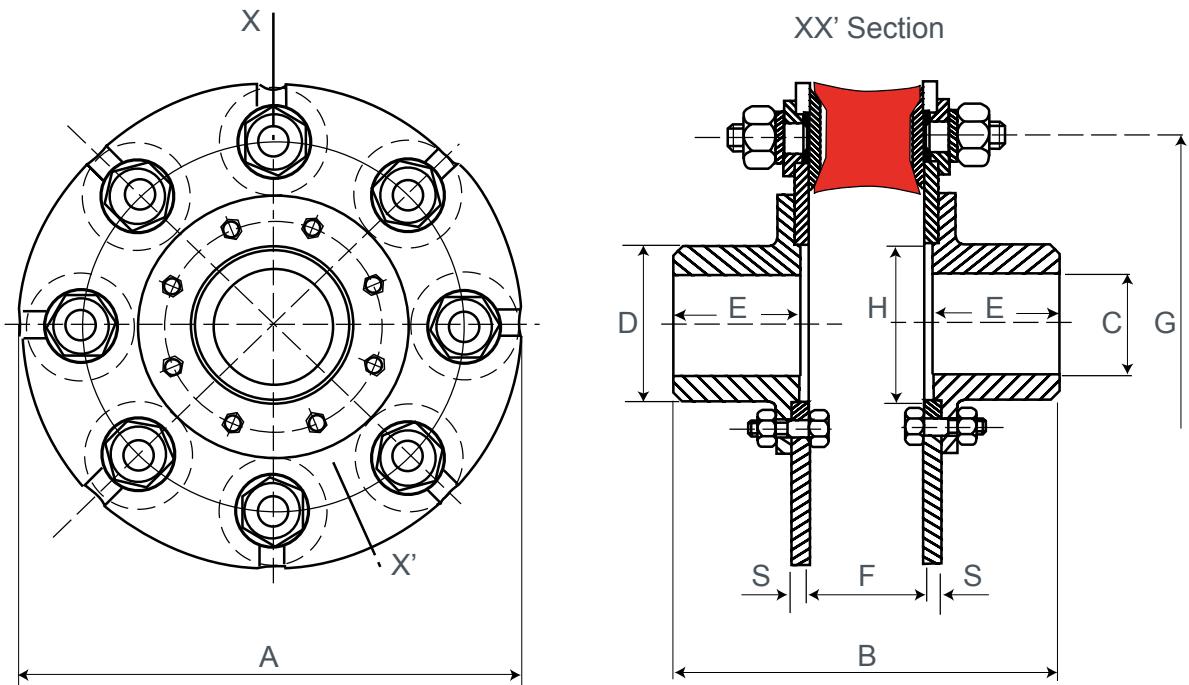

$\varnothing 12 \rightarrow 75 \text{ N.m}$        $\varnothing 14 \rightarrow 122 \text{ N.m}$        $\varnothing 16 \rightarrow 185 \text{ N.m}$

## Method : (flywheel) :

- mount the flange onto the shaft end;
- bolt the disk onto the flange;
- attach the external armature of the studs to the disk;
- attach the internal armature of the studs to the flywheel of the second machine.

# 1 - GENERAL

## 1.1 - What is a seal ?

An element forms a sealing function when it prevents the passage of a fluid from one enclosure to another. Such elements are called "Seals".

If the object is to prevent the flow of a fluid from an enclosure into a neighbouring enclosure **the seal is called a single seal**. If the seal must prevent the flow of another fluid which may be in the second enclosure into the first, **the seal is called a double seal**.

If the two mechanical parts between which the leakage is likely to occur are fixed with relation to each other, **the seal is called a static seal**. If one or both of these parts is moving relative to the other, **the seal is called a dynamic seal**.

In this document, we will only be dealing with **dynamic seals**.

In practice, we only meet two sorts of relative movement, which may or may not be combined:

- linear translation (such as the sliding of a piston in a cylinder);
- rotation (the relative rotation about a common axis of a shaft in a hub or a crank case).

## 1.2 - Types of seals

Many different methods have been or are still used for sealing such as :

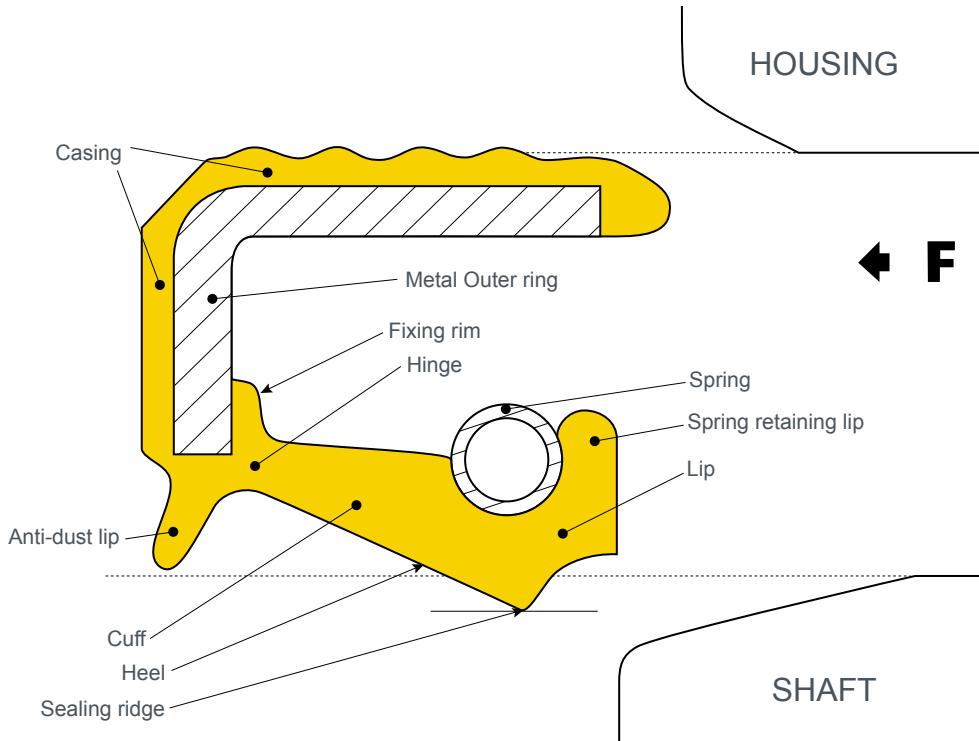

- labyrinth glands;
- stuffing-boxes;
- O-rings;
- lip seals;
- surface seals.

- **Labyrinth glands** are frictionless seals. They do not provide total sealing and do not seal if completely immersed in the fluid.
- **Stuffing-boxes** work by packing fibrous material which may or may not be braided tightly around a shaft by means of axial pressure applied by a screw cap or a flange tightened by a bolt. For many years, they have been the most common type of seals used. They produce a high frictional torque and absorb a relatively high amount of power. Although for many applications they have been replaced by lip seals or "surface" seals, they are still used a great deal, especially in the case of fluids under high pressure.
- **O-rings** are rings of synthetic elastomer of various cross-sections, most often circular (hence the name) but sometimes in the form of an X or a cross. They are most often used for static seals but can also be used in some cases as seals for rotating shafts, particularly at low speeds. They also give rise to a high frictional torque.
- **Lip seals for rotating shafts.** Lip seals first appeared about fifty years ago. They consisted of a leather cuff (which could be chromed) whose lip was kept in contact with the rotating shaft by an annular spring. In order to keep both the spring and the leather cuff in position, the parts were encased in a set of metallic collars and rings (normally at least three) which were crimped into each other. The external collar would usually be ground to size and "hard" mounted in a fixed hub. This type of seal was used a great deal, but its life was restricted as the leather wore out particularly in high temperatures. Nowadays, the leather has been replaced by synthetic elastomers which appeared on the market some forty years ago and gradually took over the role of the leather. The first of these elastomers to appear is today known as N.B.R. (Nitrile Butadiene Rubber) and was noted for its resistance to organic solvents, in particular liquid fuels and lubricating oils, even at high temperatures. The first seals manufactured had the same structure as the leather seal with its three crimped metal rings. The development of processes which ensure a very good bonding of N.B.R. to metal has enabled the structure of the seal to be simplified and has given it its present classic general shape.  
The discovery of new elastomers enables us to offer the user an increasingly varied range of seals, which are capable of solving increasingly difficult problems.

Segré's Plant (Maine-et-Loire) - ISO 9001

## 1.3 - Description of lip seals

In outline, a seal for a rotating shaft consists of three essential parts :

- the outer ring;
- the elastomer;
- the spring.

- **The Outer ring** usually consists of a metal ring in stamped steel with a right-angled cross-section.

- **The elastomer** is itself made up of 3 parts :

- the casing;
- the cuff;
- the lip.

- The casing (from the front surface to the back of the seal) is the part of the elastomer which is bonded to the Outer ring. It can cover it more or less entirely on the interior and/or the exterior.

- The cuff is cylindrical or slightly conical in shape and joins the Outer ring and the casing to the lip. It ensures a static seal and due to its elasticity - which is greater as it is longer - it allows slight movement of the lip due to movement of the shaft other than rotation.

- The lip is the element which ensures the dynamic seal by direct frictional contact with the shaft. It is made up of an annular beading including a double bevel forming a sharp ridge which is concentric with the perpendicular axis of the seal. The inclination of the surfaces of the bevel is designed to ensure the seal against leakage of a fluid situated on the side marked F.

- **The spring** is a spiral prestressed spring. It forms an annular ring. The join is usually effected by screwing into one end the conical spiral parts of the other end. The spring is fitted by light pressure into a groove in the beading of the lip.

## 2 - MATERIALS USED

### 2.1 - Armatures

Standard material : sheet steel of XE quality (AFNOR standard A 36 401)  
Special outer rings can be produced using other materials for special applications.

### 2.2 - Springs

Standard : Stabilised XC 70 steel  
On request : Z10 CN 18-09 stainless steel (AFNOR standard A 35 586).

**NOTA : All the PAULSTRA range of fluorinated elastomer seals fluorocarbon (FKM) are equipped with stainless steel springs.**

### 2.3 - Elastomers

STANDARD MIXES	Mixes	Symbols	*Temperature range
	<b>NITRILE (acrylo-nitrile butadiene)</b>  This material is particularly resistant to the action of mineral oils and grease.  Suitable in most other cases.	NBR	- 30°C to + 110°C
	<b>FLUOROCARBON ELASTOMER</b>  This elastomer has the best chemical and heat resistant characteristics.  The new fluorocarbon formula offers very low abrasion and : - low shaft and lip wear. - resistance to ageing.	FKM	- 20°C to + 200°C

\* Temperatures on samples

# 3 - THE SELECTION OF A SEAL FOR A ROTATING SHAFT\*

## 3.1 - The type of fluid to be sealed

The fluids in contact with each face of the seal can be gases or liquids which are more or less viscous even pasty (in the case of greases). They must not have too aggressive actions on the materials which make up the seal (the outer ring, spring and elastomer).

### 3.1.1 - Armature and spring

The armature and spring of standard seals are steel, so they have a good resistance to all the chemical solvents which are currently used in industry with the exception of water and aqueous liquids which can cause rust and corrosion.

For any other kind of material, please consult our technical services.

### 3.1.2 - Elastomer

#### Chemical resistance

The standard seals made from a nitrile elastomer based mix have been designed to resist most current lubricating oils.

**For more aggressive fluids, a formula based on fluorinated elastomer fluorocarbon (FKM) would be more appropriate.**

FLUIDS	ELASTOMERS		Nitrile (NBR)	Fluoro-carbon elastomer (FKM)

A: Good chemical resistance B: Average performance  
C: Acceptable (depending on conditions of use) D: Unsuitable  
\* For rotating housing applications please consult us.

## Mechanical resistance

The new brown colored fluorocarbon (FKM) formula presents a very low abrasivity and :

- low shaft and lip wear;
- resistance to ageing.

## Heat resistance

For good performance an elastomeric seal must be used within its operating temperature range. The standard elastomeric mix is not only sensitive to high temperatures which harden it causing cracks and fissures, but also to intense cold which makes it hard and hardens it. The temperature which must be considered is that at the contact lip. It must be borne in mind that this gets much hotter than the ambient fluid, due to friction. For example, the temperature of the lip of a seal which seals the motor oil of a crankcase, where the shaft is rotating at high velocity (more than 8 m/s), can increase by about fifty degrees after a few minutes of service, whereas the oil, even next to the seal, will only warm up by a few degrees in the same period. The temperature displayed by a thermometer dipped into the crankcase oil is not therefore a determining factor.

In addition to the shaft speed, which is the most important factor, other parameters influence the heating of the lip such as the condition of the shaft surface, the tightness of the seal, the ventilation of the crankcase, and so on, so that it is very difficult to know the temperature of the lip in continuous operation.

The temperatures indicated in the table below are only valid if the fluid being sealed is not degraded at these temperatures.

**Where high temperatures exceed the values shown in the table below, use seals in fluorinated elastomer.**

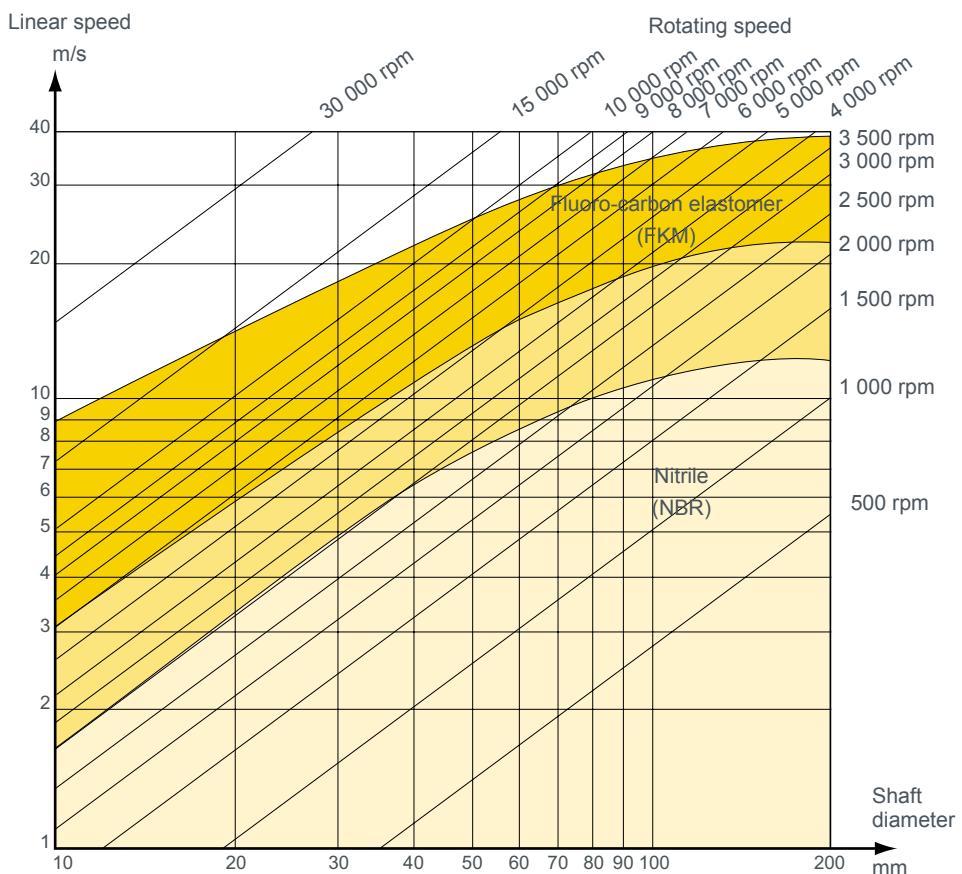

**Our technical services are at your disposal to reply to your questions about the properties of various mixes.**

		Nitrile (NBR)		Fluoro-carbon elastomer (FKM)	
Low temperature in °C (1)		- 40		- 30	
Temperature in °C		Av. (2)	Max (3)	Av. (2)	Max (3)
<b>Products to be sealed</b>

	Brake fluid	--		--	

- (1) Temperature at which the seal continues to function.
- (2) Average operating temperature.
- (3) Maximum permissible temperature for not more than 10 hours over the life of the seal.
- + Resistant, but normally not used.
- Resistant, under certain conditions.
- Does not resist.

## 3.2 - Shaft speed

The graph below gives an indication of the rotary or linear velocity of the shaft in relation to various elastomers which are permissible under normal conditions of use.

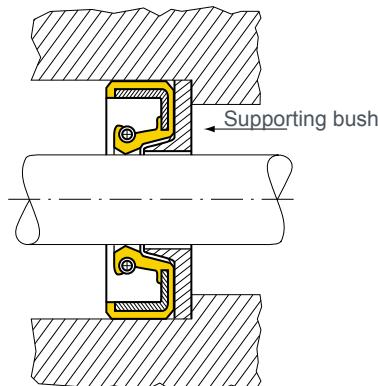

## 3.3 - Pressure

The effective pressure to which a seal is submitted is the difference between the pressures of the fluids on each of its two sides (one of which is often the atmosphere). It is clear that the sealing lip should be found on the side which has the higher pressure. In theory, the lip seal for rotary shafts is not a pressure seal.

However, most PAULSTRA seals will resist pressures of the order of 0.5 bars without special precautions if the velocities do not exceed 3 m/s. At higher pressures, there is a risk that the lip may be turned back on itself or pressed onto the shaft with a force which gives rise to an unacceptable tightness and frictional torque. At low velocities most PAULSTRA seals will bear pressures of up to 3 or 4 bars with the addition of a supporting bush. This is not provided by PAULSTRA but it can be made up by the customer according to PAULSTRA's drawings.

The effective pressure is not necessarily constant. If the variations are slow and remain within the limits above, this is not a big problem. On the other hand, if they pulsate rapidly they can interfere with the performance of the seal.

You are advised to consult our technical services for any application which involves an effective pressure greater than 0.5 bars or a pulsating pressure.

# 4 - CONDITIONS FOR GOOD OPERATION

## 4.1 - The housing

It is extremely important that there be no sharp edges.

Our recommendations are shown on the figure below :

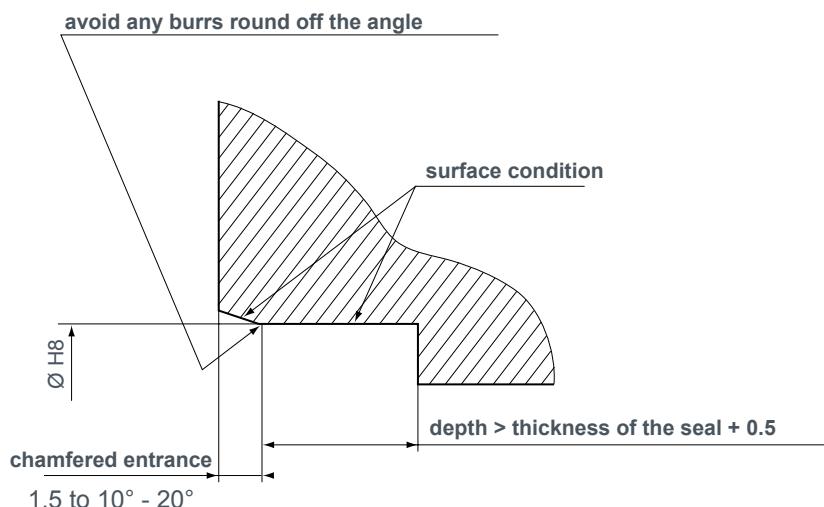

**Recommended shape of the housing :**

- for a covered seal :

$R = 4 \text{ to } 12,5 \mu$   
 $Ra = 1,6 \text{ to } 4 \mu$

- for an external outer ring :

$R = 3 \text{ to } 8 \mu$   
 $Ra = 1,2 \text{ to } 2,5 \mu$

**Note :** if the housing is made of a material with a high coefficient of expansion, this must be taken into consideration when defining the interference (tightness) with the seal.

The lack of a chamfer or too small a chamfer can cause :

- a deterioration of the exterior of the seals (cutting of the elastomer or stripping of the sealing lacquer);
- a big increase in the force of insertion which could cause deformation of the outer ring;
- a defective axial positioning.

A surface with a very rough finish can cause the same problems and can therefore also be the reason for a leak. On the other hand, if the finish is too smooth the extraction force may be too low.

## 4.2 - The shaft

The PAULSTRA recommendations are as follows :

- **Tolerance on the diameter** : h 11.
- **Surface state** :  $R = 0.4$  to  $1.2$  ED (so  $Ra \approx 0.2$  to  $0.5$ ).
- **Hardness** : if  $V \leq 4$  m/s : 45 HRC minimum (say 455 HV or 155 kg/mm<sup>2</sup>).  
if  $V > 4$  m/s : 55 HRC minimum (say 625 HV or 195 kg/mm<sup>2</sup>).
- **Thickness of the treated zone** : 0.3 mm minimum.
- **Circularity** : 5 microns.
- **Neutrality** : All machined surfaces have grooves from the machining process. If these grooves are inclined in relation to the axis of the shaft, they form a helix which will produce a hydrodynamic action.

**The bearing surfaces of a seal must be neutral** (i.e. there must be no orientation of the machining grooves).

It is possible to orient the machine grooves deliberately to produce pumping from the exterior to the interior of the mechanism. However, **we advise against this as there will be increased wear of the seal**.

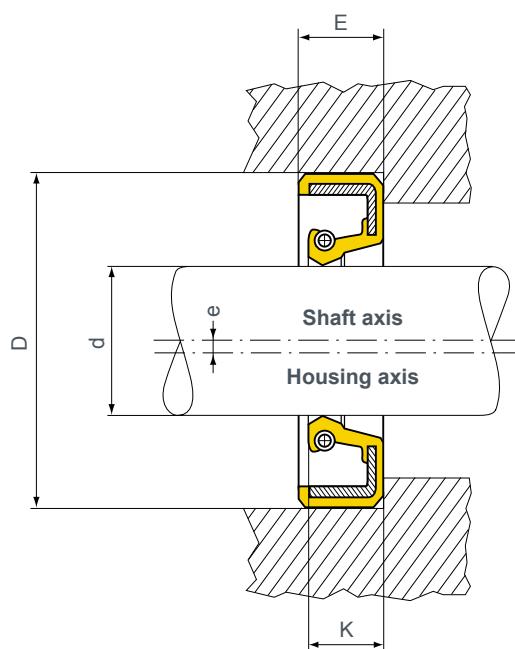

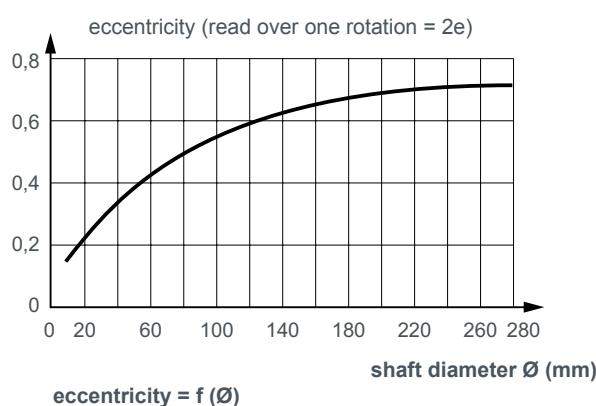

Hard chroming is also not to be recommended, unless it is of sufficient thickness and quality.

## 4.3 - Eccentricity between the housing and the shaft

The housing and the shaft should be centred on one another as precisely as possible. If there is a radial displacement between the axis of the seal and the axis of the shaft, the suppleness of the rubber lip enables assembly without "yawning" within certain limits.

The eccentricity is the distance between the axis of the seal housing and the axis of the shaft, the two axes being parallel to each other.

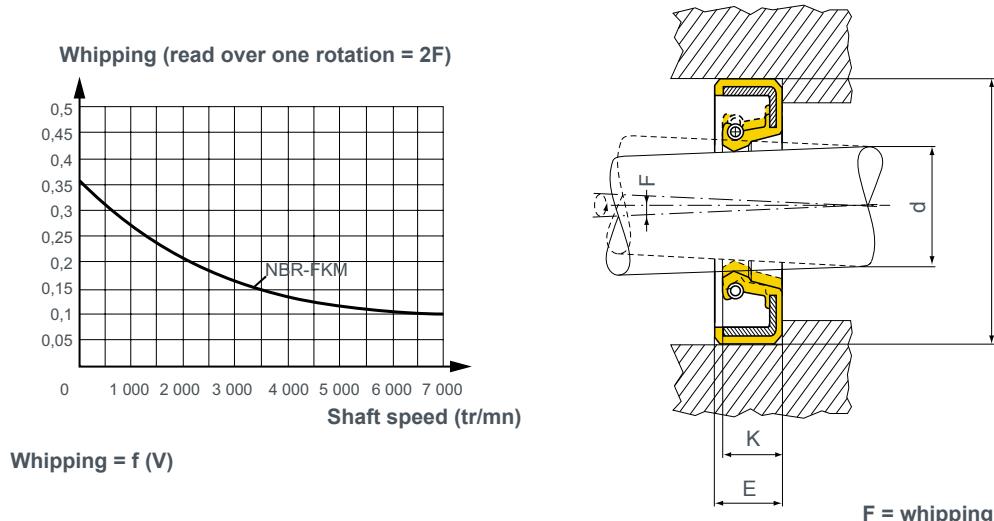

The curve below shows the maximum permitted eccentricities as a function of the shaft diameter.

## 4.4 - Whipping and out of true

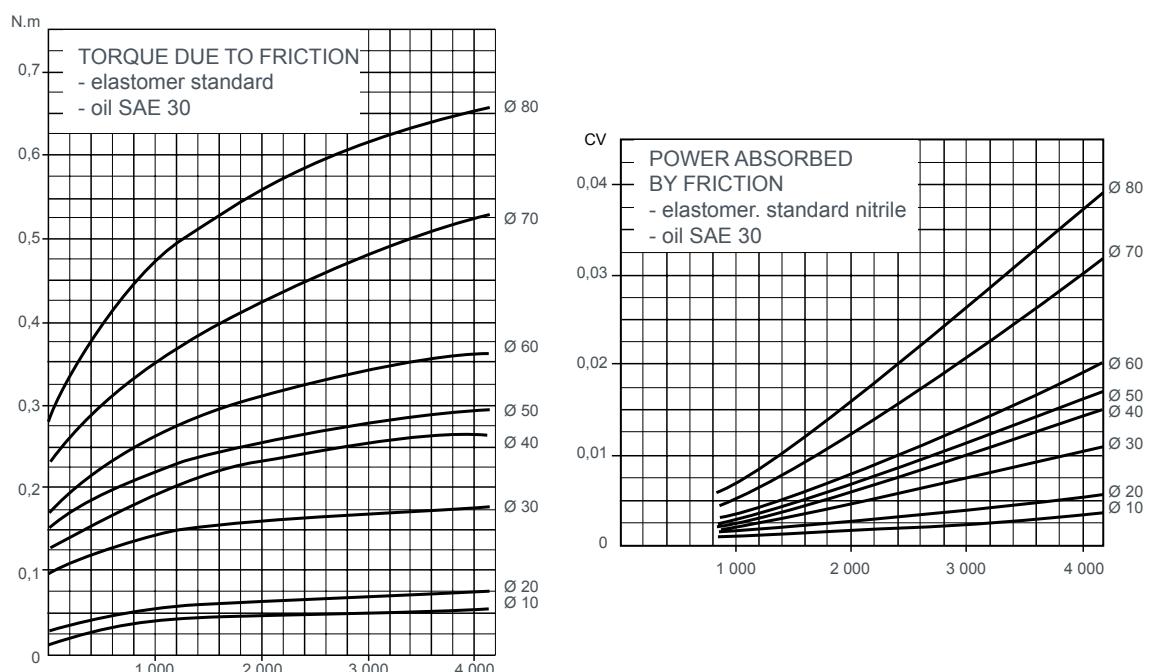

This phenomenon occurs when the geometric axis of the shaft does not coincide exactly with the rotational axis. This can be the result, for example, of a worn bearing or the bending of the shaft. The amplitude of whipping increases with distance from a bearing, so the seal should be placed as near as possible to the bearings. Whipping is measured in mm by the radius of the circle described by a point on the axis of the shaft which is in the same plane as the lip.

The curve below shows the maximum whipping permissible as a function of the rotational velocity of the shaft.

## 4.5 - Power absorbed due friction

Due to its design, a lip seal produces friction which will provide some resistance to the rotation of the shaft. For a chosen speed, the resisting torque is function of : the shape of the seal, the friction coefficient and other environment factors such as (materials, tightness of the seal on the shaft, roughness of the shaft, wear, lubrication, temperature ...).

The curves above gives a first indication for the standard Nitrile elastomer. They were plotted under average working conditions using a standard seal with little wear and a lubricated shaft with good surface finish and running temperature of less than 100 °C.

# 5 - THE ASSEMBLY OF SEALS

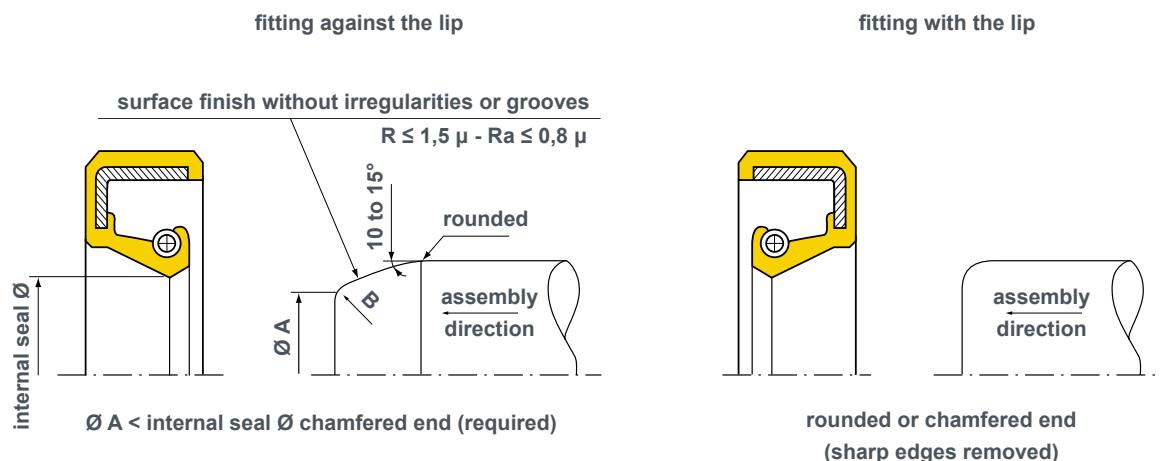

The assembly of seals is a very delicate operation which can ruin the efficiency of a very good product if it is not done properly.

The assembly of a seal must be done in accordance with the following rules :

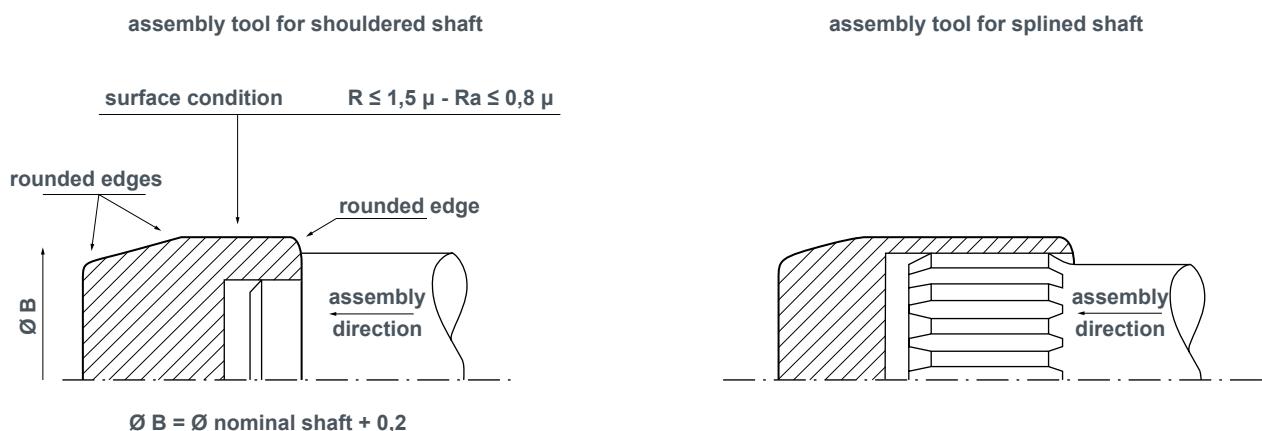

- avoid damage to the lip;
- avoid damage to the cover of the external diameter;
- lubricate the sealing ridge to avoid damage at the first start-up;
- position the seal correctly :
  - misalignment (the seal must be perpendicular in relation to the axis);
  - axial position.

The information given below should help constructors to put these rules into practice.

## 5.1 - Assembly on a shaft without splines

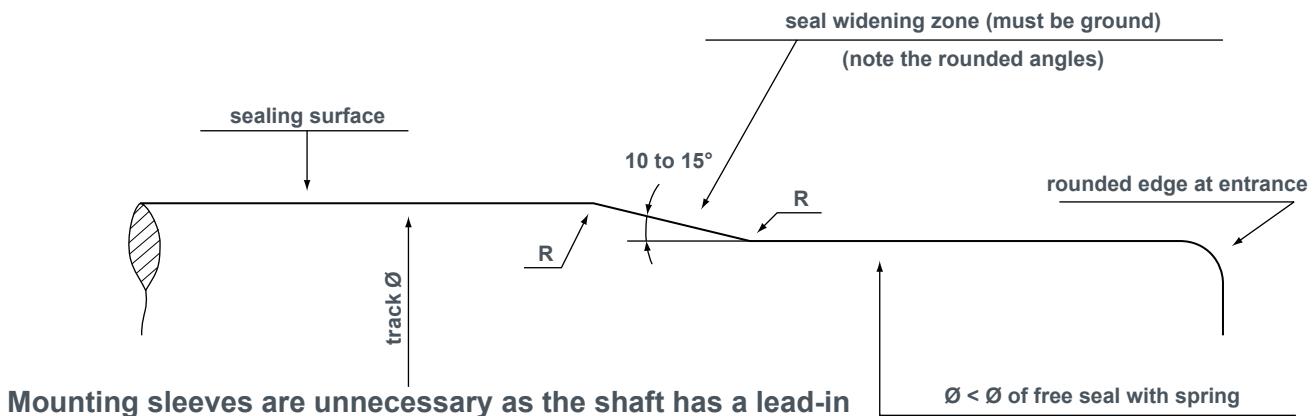

## 5.2 - Assembly on a shaft with splines or a shoulder

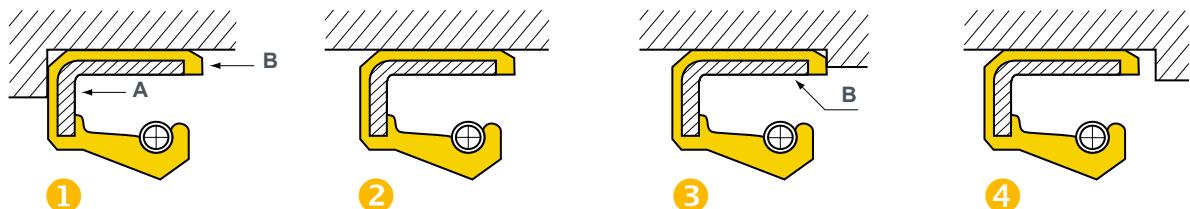

The use of these assembly tools is helpful. However, we recommend the use of a lead-in on the shaft whenever possible.

## 5.3 - Paulstra recommendations for the shape of the shaft

## 5.4 - Axial positionning and alignment

- 1 The seal is mounted against a stop on the rear side. This presents no particular problem provided that pressure is applied at "A" to insert it and not "B".
- 2 Here there is no axial stop. The mounting tool positions the seal both axially and perpendicularly.
- 3 The seal is mounted against a stop on the front side. This should be avoided as the elastomer at B could be compressed and the seal will tend to move out of position.
- 4 The housing has a shoulder as in 3, but the seal is positioned by the mounting tool. This case joint is preferable to case 3.

The mounting tool should be designed to position the seal correctly both axially and perpendicularly but its shape should be such as to allow deformation of the elastomer covering the outer ring towards the rear, thus avoiding cutting the covering at the time of insertion. In some cases, the bead "C" does not get cut off and sticks between the housing and the assembly mandrel in which case it is impossible to locate the seal. When the seals have an anti-dust lip, care should be taken that the mounting tools do not turn it back on itself.

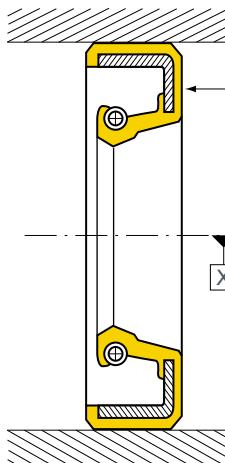

While it is true that modern seal design (corrugations on the outside, pre-centred shape chamfers without burrs, etc.) tends to reduce problems during assembly, the comments made are still worth noting.

Also, the elastomer part of a semi-covered seal behaves in the same way as a fully covered seal.

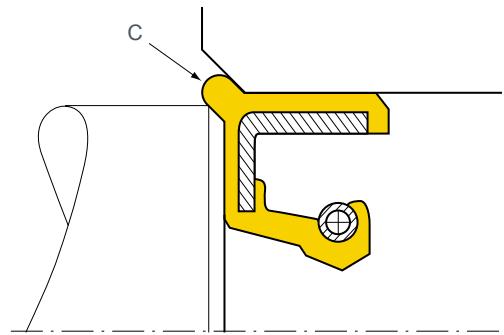

- Time should be allowed during assembly to allow in order to allow the elastomer time to settle.
- The seal must be held in position for a few seconds once mounted to avoid too large a return movement.

#### We recommend the following :

- $V = 1200 \text{ mm/mn}$  (maximum :  $1500 \text{ mm/mn}$ ).
- time held in position: 5 seconds (minimum 2 seconds).

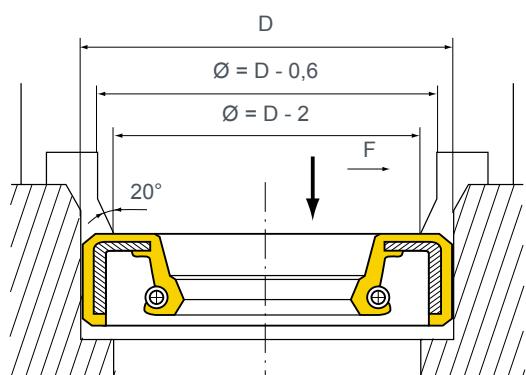

Perpendicular tolerance

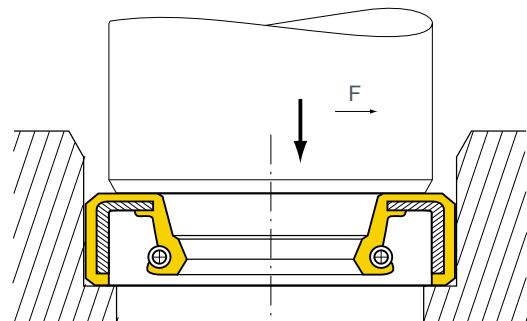

Formation of the bead

## 5.5 - Recommendations for the assembly tool

GOOD

TO BE AVOIDED

## 5.6 - Lubrication during assembly

While the first means of avoiding damage to the outside of the seal is to pay attention to the housing characteristics, the second means, which is just as important, is lubrication :

- be it of the housing;
- or the outside of the seals;
- or both at the same time.

This not only avoids damage to the seal but also ensures a better axial positioning.

A seal whose outside diameter is not lubricated will certainly be damaged on the outside when it is mounted in a dry housing (elastomer cover cut or ripped sealing lacquer removed).

Also, when the unit is started up, the oil will always take some time before it reaches the lip of the seal (from a few seconds to a few tenths of seconds depending on the application).

If it is the first start, and if the lip has not been lubricated at assembly, it will function "dry" dynamically which will lead to great wear and the risk of total deterioration.

It is therefore essential to lubricate the sealing ridge.

For later starts, the problem is different because a film of oil will be retained under the lip by capillarity action.

## 5.7 - Reminder of the main principles of assembly

- Protect the lip and the outside of the seal by paying attention to the recommendations for the Shaft and the housing.
- Apply the insertion force to the rigid part of the outer ring.
- Centre the seal correctly in relation to the housing and/or the shaft.
- Lubricate the outside diameter and/or the housing.
- Lubricate the sealing ridge.

# 6 - CLASSIFICATION OF THE MAIN PROFILES OF LIP SEALS

	SPRING			CORRUGATED COVER (W)	ANTI-DUST LIP		RIDGES		
	embedded (I)	visible (E)	none (O)		WITHOUT SPRING (L)	WITH SPRING (R)	on the left (G)	to the right (D)	bi-direct. (V)
	II	IE	IO		IEW	IEL	IELR	IEG	IED
I Covered outer ring									
E Bare outer ring	-			-					
CS Bare outer ring reinforced	-	-	-	-		-	-	-	-
M Semi-covered outer ring	-								

Note : other cases are available

X = exterior lip

S = special cross-section

P = protector

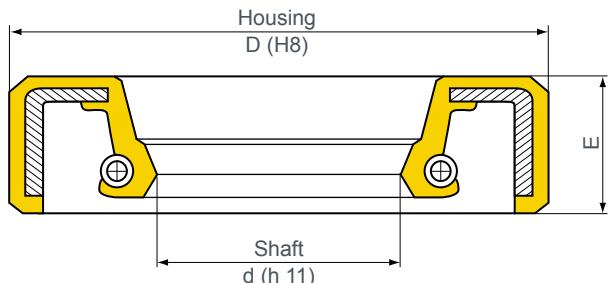

## CLASSIFICATION EXAMPLE

<b>ME</b> WLR	<b>ME</b> WG	<b>M</b> OWL

# CATALOGUE OF SEALS FOR SLIDING SHAFTS

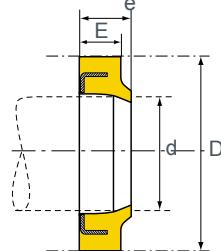

Type DL

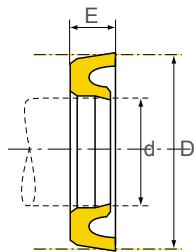

Type LIO

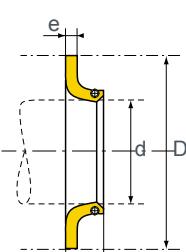

Type LEO

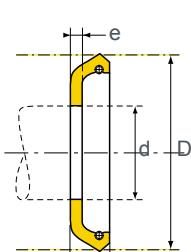

Type DRT

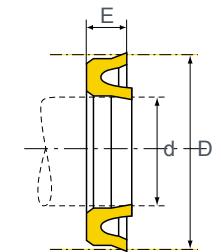

Type DLI

Type LIR

Type LER

Type DLE/DLES

- Width of the groove : E + 1 mm (for DL).

- Operating parameters :

Maximum admissible pressure : 150 bars (for DL) ; 30 bars (for LIO, LEO).

Linear speed admissible : up to 0.3 m/sec depending on the operating conditions.
