

JUBOFLEX® "S"

*** Torsional flexibility

** Radial flexibility

*** Axial flexibility

*** Conical flexibility

DESCRIPTION

- Flexible element
 - ① Precompressed natural rubber.
 - ② Bonded metal reinforcing mountings.
 - ③ Precompression band (to be removed after installation).
- Flange
 - ④ Die-cast steel (except 632267 which is cast-iron).

OPERATION

The JUBOFLEX «S» coupling is designed with the following features :

- radial disassembly without moving the machines that are coupled;
- the flexible element is compressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

Advantages

- JUBOFLEX «S» has a greater load capacity than the standard JUBOFLEX.
- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Due to the precompression, the JUBOFLEX «S» has very good resistance to torsional peaks.
- Tolerance to large misalignment: avoids the need for precise alignment of the machines to be coupled.

Recommendation

- In use, precompression is achieved by the fixing bolts, and the JUBOFLEX «S» coupling operates without the precompression band round the flexible element.

DIMENSIONS

Flanges supplied unbored

JUBOFLEX Steel flanges except 632267 JUBOFLEX Cast-iron flanges : ref. 632267

* Diameter of passage in flexible element under the nominal torque.

Please see current price list for availability of items.

The maximum torque is considered to be an infrequent start-up torque and is not periodic.

PARTS LIST

The flexible elements are delivered precompressed using a precompression band which should be removed after installation.

Coupling without protector	Flexible element		Flange	
	Reference	Qty	Reference	Qty
632260	632550	1	321314	2
